

# **VISVESVARAYA TECHNOLOGICAL UNIVERSITY**

**“JnanaSangama”, Belgaum -590014, Karnataka.**

## **LAB RECORD**

### **Computer Network Lab (23CS5PCCON)**

*Submitted by*  
**Abhishek patil (1BM23CS013)**

*in partial fulfillment for the award of the degree of*

**BACHELOR OF ENGINEERING**  
*in*  
**COMPUTER SCIENCE AND ENGINEERING**

**B.M.S. COLLEGE OF ENGINEERING**

**(Autonomous Institution under VTU)**

**BENGALURU-560019**

**September 2025 – January 2026**

**B. M. S. College of Engineering,**  
**Bull Temple Road, Bangalore 560019**  
(Affiliated To Visvesvaraya Technological University, Belgaum)  
**Department of Computer Science and Engineering**

**CERTIFICATE**

This is to certify that the Lab work entitled “Computer Network (23CS5PCCON)” carried out by **Abhishek patil(1BM23CS013)**, who is bonafide student of **B.M.S. College of Engineering**. It is in partial fulfilment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum. The Lab report has been approved as it satisfies the academic requirements of the above-mentioned subject and the work prescribed for the said degree.

Praveen N

Assistant Professor

Department of CSE, BMSCE

Dr. Kavitha Sooda

Professor & HOD

# Index

## Part - A

| Sl. No. | Date     | Experiment Title  | Page No. |
|---------|----------|---|----------|
| 1       | 19/08/25 | Create a topology and simulate sending a simple PDU from source to destination using hub and switch as connecting devices and demonstrate ping message. | 1 – 4    |
| 2       | 09/09/25 | Configure DHCP within a LAN and outside LAN.  | 5 – 8    |
| 3       | 09/09/25 | Configure Web Server, DNS within a LAN.   | 9 – 11   |
| 4       | 09/09/25 | Configure IP address to routers in packet tracer. Explore the following messages: ping responses, destination unreachable, request timed out, reply.    | 12 – 14  |
| 5       | 23/09/25 | Configure default route, static route to the Router.  | 15 – 18  |
| 6       | 23/09/25 | Configure RIP routing Protocol in Routers.  | 19 – 22  |
| 7       | 14/10/25 | Configure OSPF routing protocol.  | 23 – 25  |
| 8       | 14/10/25 | To construct a VLAN and make the PC's communicate among a VLAN.   | 26 – 28  |
| 9       | 11/11/25 | To construct a WLAN and make the nodes communicate wirelessly.  | 29– 32   |
| 10      | 11/11/25 | Demonstrate the TTL/ Life of a Packet.  | 33 – 36  |
| 11      | 18/11/25 | To understand the operation of TELNET by accessing the router in server room from a PC in IT office.  | 37– 41   |
| 12      | 18/11/25 | To construct simple LAN and understand the concept and operation of Address Resolution Protocol (ARP).  | 42 – 45  |

## Part - B

| Sl. No. | Date     | Experiment Title  | Page No. |
|---------|----------|---|----------|
| 1       | 28/10/25 | Write a program for congestion control using Leaky bucket algorithm.  | 46 – 49  |
| 2       | 17/11/25 | Using TCP/IP sockets, write a client-server program to make client sending the file name and the server to send back the contents of the requested file if present. | 50 – 51  |
| 3       | 17/11/25 | Using UDP sockets, write a client-server program to make client sending the file name and the server to send back the contents of the requested file if present.    | 52 – 53  |
| 4       | 28/10/25 | Write a program for error detecting code using CRC-CCITT (16-bits).   | 54 - 58  |

Github Link:

## PART - A

### Program 1:

**Aim:** Create a topology and simulate sending a simple PDU from source to destination using hub and switch as connecting devices and demonstrate ping message.

### **Topology:**

#### 1. STAR Topology with Switch:

#### 2. MESH Topology with Switch:

#### 3. HUB-Based Network Topology:

## **Procedure:**

### **1. Create STAR Topology Using a Switch**

1. Open Cisco Packet Tracer and go to the End Devices section.
2. Drag and drop PCs (PC0, PC1, PC2, PC3, PC4) into the workspace.
3. From Switches, drag a 2950-24 switch to the center.
4. Connect each PC to the switch using Copper Straight-Through cables:
  - PC0 → Switch (Fa0/1)
  - PC1 → Switch (Fa0/2)
  - PC2 → Switch (Fa0/5)
  - PC3 → Switch (Fa0/3)
  - PC4 → Switch (Fa0/4)
5. Assign IP addresses to PCs:
  - Go to PC → Desktop → IP Configuration
  - Enter the IP address/subnet for each PC (any address in same network).
6. Test connectivity:
  - Use Add Simple PDU tool to send a ping from one PC to another.

### **2. Create MESH Topology Using Switches**

1. Drag and drop PCs (PC0, PC1, PC2, PC3, PC4).
2. Add two 2950-24 switches to the workspace.
3. Create mesh-style interconnections:
  - Connect each PC to the nearest switch.
  - Connect Switch1 ↔ Switch2 with multiple redundant links (e.g., Fa0/1 ↔ Fa0/3, Fa0/2 ↔ Fa0/4).
4. Assign IP addresses to all PCs within the same network.
5. Verify STP operation automatically blocks redundant paths.
6. Use Simple PDU (ICMP) to test ping between:
  - PC0 → PC3
  - PC1 → PC4
  - PC2 → any node
7. View packet movement under Simulation Mode.

### **3. Create HUB-Based Topology**

1. Drag and drop PCs (PC5, PC6, PC7, PC8, PC9).
2. From Hubs section, drag a Generic Hub (Hub0).
3. Connect each PC to the hub using Copper Straight-Through cable:
  - PC5 → Hub Fa0
  - PC6 → Hub Fa1
  - PC7 → Hub Fa2
  - PC8 → Hub Fa3
  - PC9 → Hub Fa4
4. Assign IP addresses within the same network for all PCs.
5. Use Simulation mode to send Simple PDU.
6. Observe broadcast behavior:
  - Hub sends the packet to all devices.

#### 4. Demonstrate Ping Message (ICMP)

1. Switch to Simulation Mode from bottom-right corner.
2. Select the Simple PDU Tool (envelope icon).
3. Click on Source PC, then Destination PC.
4. Playback controls:
  - o Play to observe step-by-step
  - o Fast Forward for quick simulation
5. Watch the ICMP request and reply in the Event List window

#### Output:

The screenshot displays the Cisco Packet Tracer interface. The main workspace shows a network topology with three interconnected LANs. The left LAN contains PC0, PC1, and PC2 connected to a switch. The middle LAN contains PC3, PC4, and PC5 connected to a switch. The right LAN contains PC6, PC7, and PC8 connected to a switch. The switches are interconnected via their Fa0/24 ports. The Event List window is open on the right, showing a list of events. The first event is an ICMP request from PC0 to PC4 at 0.004 seconds. The second event is an ICMP reply from PC4 to PC0 at 0.005 seconds. The bottom status bar shows the time as 00:03:45:908 and the simulation mode as Simulation.

| Vis     | Time(sec) | Last Device |
|---------|-----------|-------------|
|         | 0.004     |             |
|         | 0.005     | PC4         |
|         | 0.005     | Switch2(1)  |
|         | 0.005     | PC5         |
| Visible | 0.006     | Switch4     |
| Visible | 0.006     | Switch1(1)  |
| Visible | 0.006     | Hub0        |
| Visible | 0.006     | Hub0        |
| Visible | 0.006     | Hub0        |
| Visible | 0.006     | Hub0        |

| Fire | Last Status | Source | Destination | Type | Color | Time(sec) | Periodic | Num | Edit  | Delete   |
|------|-------------|--------|-------------|------|-------|-----------|----------|-----|-------|----------|
|      | In Progress | PC0(1) | PC4(1)      | ICMP |       | 0.000     | N        | 0   | (add) | (delete) |
|      | In Progress | PC5(1) | PC7(1)      | ICMP |       | 0.000     | N        | 2   | (add) | (delete) |
|      | In Progress | PC0(1) | PC3(1)      | ICMP |       | 0.005     | N        | 1   | (add) | (delete) |

## Observation:

Date: 21/08/25

Week-1

Experiment 1:

Point to point communication

Two computers are directly connected  
And their PC addresses are config  
(same domain)  
A pdd pdu is sent from PC1 to PC2

Experiment 2:

Using Hub as ~~intermediate~~

Date: 21/08/25

How three PCs are individually connected with hub using generic wire

Send a PDU source - PC1 Destination - PC2

Message is sent to both PC2 & PC3  
only PC2 accept the message

Experiment 3

Using Switch

Connect same as above but instead of Hub.

Unlike above exp message is sent only to PC2 from PC1.

Date: 21/08/25

Experiment 4

flybrid.

## Program 2:

**Aim:** Configure DHCP within a LAN and outside LAN.

### **Topology:**

### Procedure:

1. **Configure DHCP Server:**  
in DHCP server go to Desktop>IP-Config, assign static IP – 192.168.10.2 and gateway 192.168.10.1
2. **Open Services>DHCP and add following two dhcp pool:**

(a) Pool Name: switch1

Gateway: 192.168.10.1

Start Ip: 192.168.10.3

Subnet Mask: 255.255.255.0

Max Users: 20

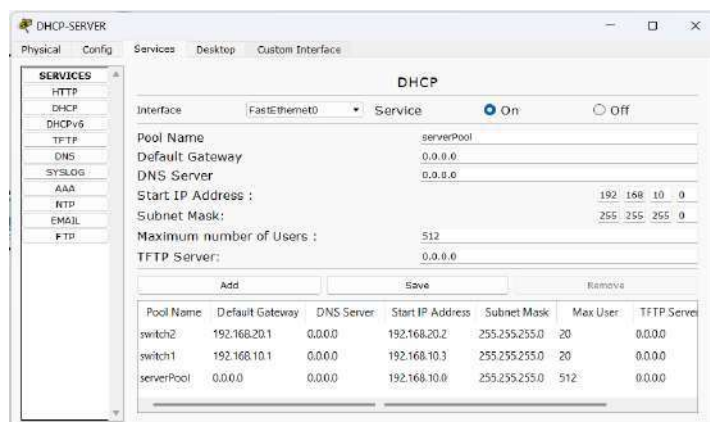

(b) Pool Name: switch2

Gateway: 192.168.20.1

Start Ip: 192.168.10.2

Subnet Mask: 255.255.255.0

Max Users: 20

### 3. Configure Router

- i. Router>enable
- ii. Router#configure terminal

(Within Lan)

- iii. Router(config)# int fa0/0
- iv. Router(config-if)# ip address 192.168.10.1 255.255.255.0
- v. Router(config-if)# ip helper-address 192.168.10.2
- vi. Router(config-if)# no shutdown
- vii. Router(config-if)# exit

(Outside Lan)

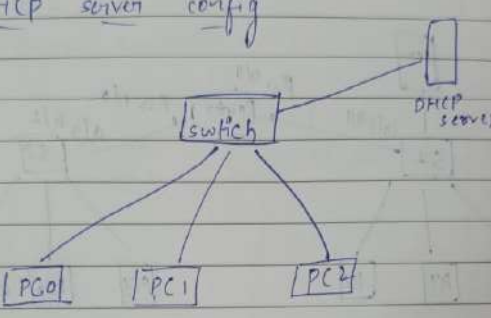

- viii. Router(config)# int fa0/1
- ix. Router(config-if)# ip address 192.168.20.1 255.255.255.0
- x. Router(config-if)# ip helper-address 192.168.10.2
- xi. Router(config-if)# no shutdown
- xii. Router(config-if)# exit
- xiii. Router(config)# exit
- xiv. Router# write memory

## Observation:

Date: 28/08/25

week - 2

8) DHCP server config

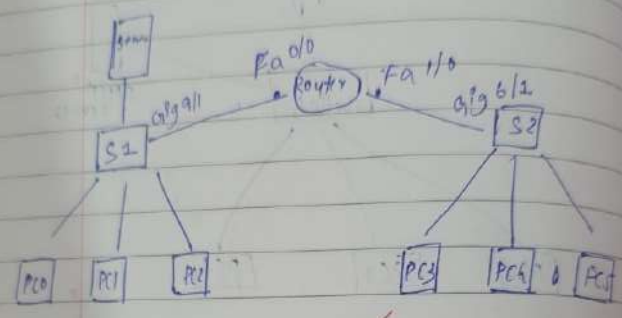

DHCP config:

Go to server then config  
select static  
give Gateway ip (192.168.10.1)  
Then services  
DHCP  
Add a server pool  
name: S1  
start ip: 192.0.0.0  
subnet: 255.0.0.0  
Add

Observation:  
when we go to PC0 cli config select DHCP. A ip address is automatically assigned.

Date:

9) DHCP config for two local network

First we have add two server pools in DHCP server

~~21/08/25~~ name: switch one  
default: 192.168.10.1  
start ip: 192.168.10.3  
limit: 20

name: switch two  
default: 192.168.20.1  
start ip: 192.168.20.3  
limit: 20

## Output:

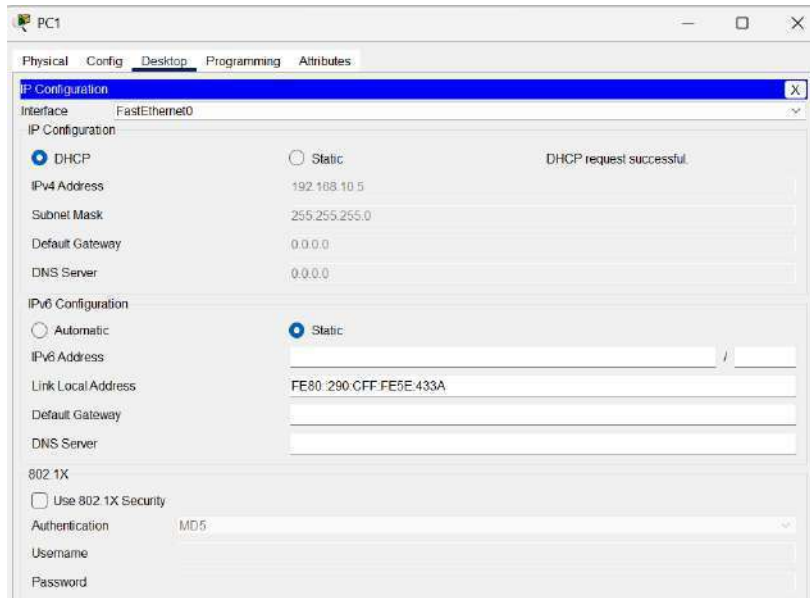

Fig 1. Ip address assigned by DHCP server within Lan (PC1)

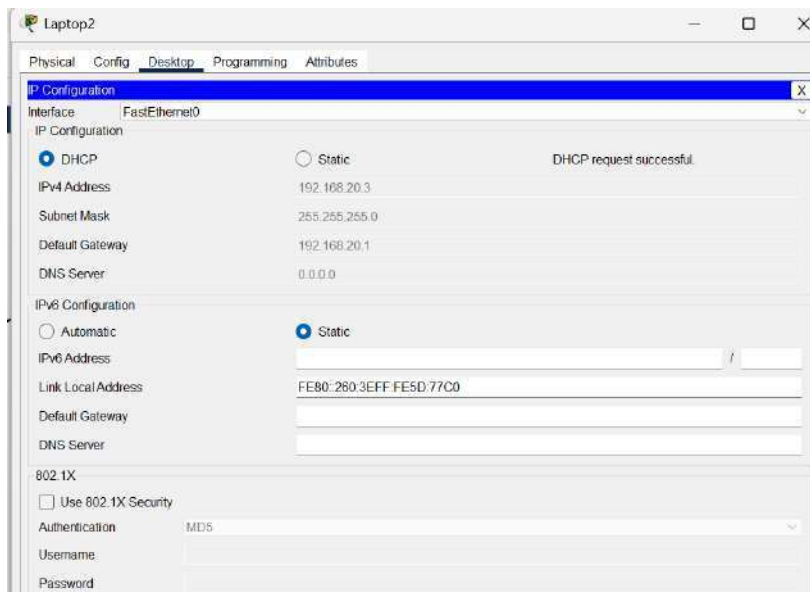

Fig 2. Ip address assigned by DHCP server outside Lan (laptop2)

### Program 3:

**Aim:** Configure Web Server, DNS within a LAN.

### Topology:

### Procedure:

#### 1. Create the Network

1. Place 1 Router, 1 Switch, 1 DNS Server, 1 Web Server, and two PCs.
2. Connect all devices using Copper Straight-Through cables.

#### 2. Assign IP Addresses

1. On each device: Desktop → IP Configuration
  - Assign IPs in same network (e.g., 192.168.1.x).
  - Set Gateway = Router's interface IP.

#### 3. Configure DNS Server

1. Open DNS Server → Services → DNS.
2. Turn DNS Service = On.
3. Add A-Record:
  - Name: letslearn.com
  - Address: IP of Web Server

- Click Add → Save.

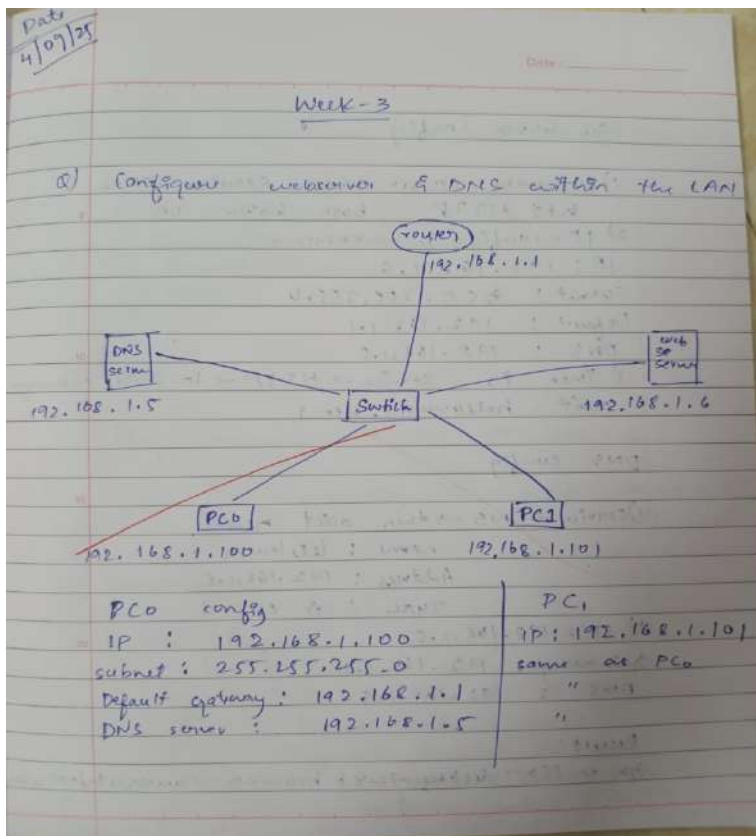

#### 4. Configure Web Server

- Open Web Server → Services → HTTP.
- Turn HTTP = On (HTTPS optional).
- Ensure index.html exists (default file is fine).
- Edit HTML if needed.

#### 5. Test from PC

- Open PC → Desktop → Web Browser.
- Enter URL:
- <http://www.letslearn.com/index.html>
- The webpage should load, confirming DNS + Web Server working.

#### Observation:

Web Server Config

- 1) Go to web server then services then HTTP both button on
- 2) IP-config in ethernet  
IP: 192.168.1.6  
Subnet: 255.255.255.0  
Default: 192.168.1.1  
DNS: 192.168.1.5
- 3) Then in services → HTTP → in File manager edit helloworld.html

DNS Config

- 1) services → DNS → then add new  
name: letslearn  
Address: 192.168.1.5  
Type: A Record
- 2) IP: 192.168.1.5  
Gateway: 192.168.1.1  
DNS: 192.168.1.5

Result:

Go to PC0 → desktop → web browser → [www.letslearn.com](http://www.letslearn.com)

## Output:

The screenshot shows the 'DNS Server' configuration window with the 'Services' tab selected. On the left, a 'SERVICES' list includes HTTP, DHCP, DHCPv6, TFTP, DNS (highlighted), SYSLOG, AAA, NTP, EMAIL, FTP, IoT, VM Management, and Radius EAP. The main area shows the 'DNS' service is 'On'. Below, the 'Resource Records' section has a 'Name' field and a 'Type' dropdown set to 'A Record'. An 'Address' field is also present. At the bottom, a table lists the resource records.

| No. | Name              | Type     | Detail      |
|-----|-------------------|----------|-------------|
| 0   | www.letslearn.com | A Record | 192.168.1.6 |

Fig 1. DNS server – DNS Services

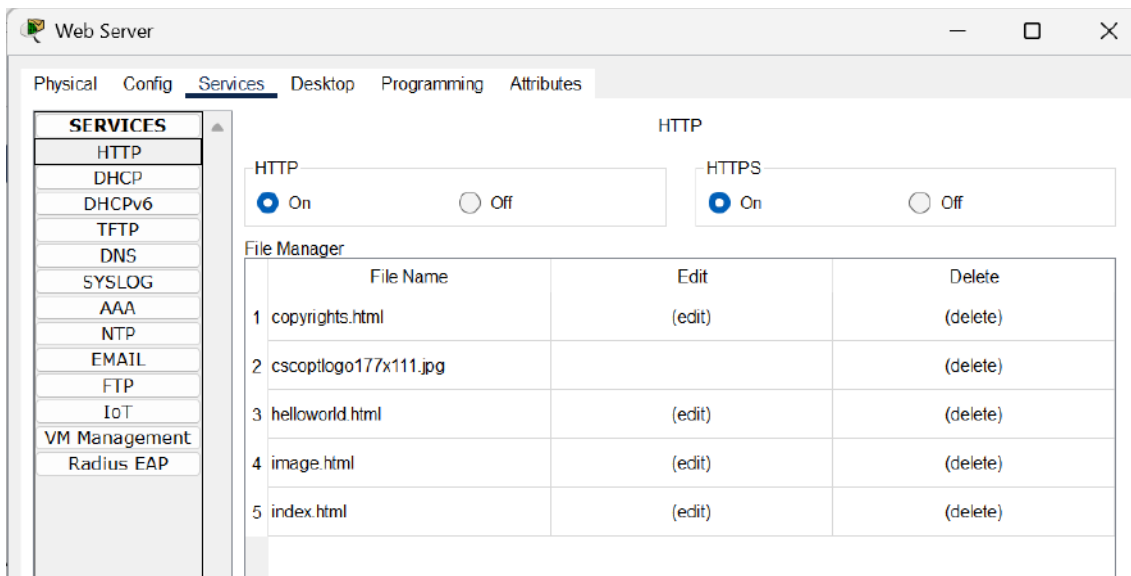

Fig 2. WEB server – HTTP Services

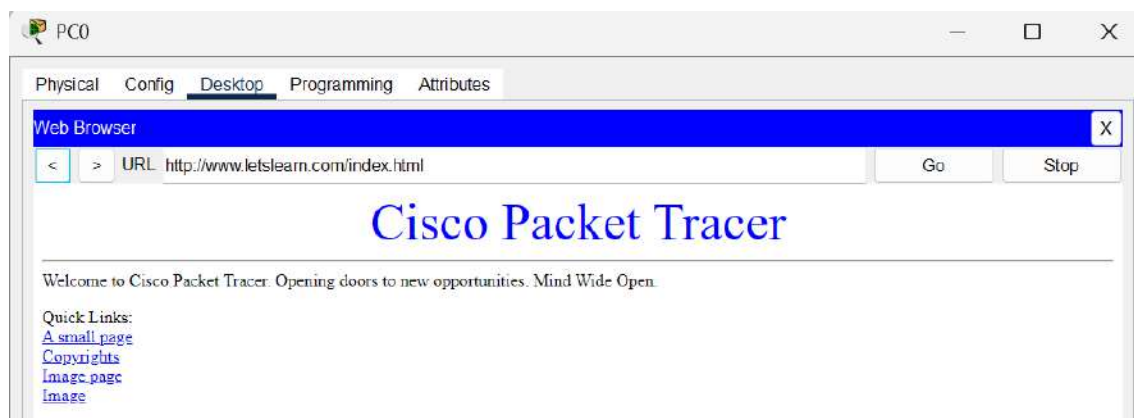

Fig 3. PC0 – accessing data from web browser

## Program 4:

**Aim:** Configure IP address to routers in packet tracer. Explore the following messages: ping responses, destination unreachable, request timed out, reply.

## Topology:

## Procedure:

### 1. Assign IP Addresses to Router Interfaces

1. Click the Router → Config → Interfaces.

### 2. Configure and enable:

- Fa0/0 → IP: 192.168.1.1 /24
- Fa0/5 → IP: 192.168.2.1 /24

### 3. Turn Port Status = On for each interface.

2. Assign IP Addresses to PCs and Servers

1. On each device → Desktop → IP Configuration.

2. Use matching networks:

- Devices connected to Fa0/0 → IP: 192.168.1.x, Gateway: 192.168.1.1
- Devices connected to Fa0/5 → IP: 192.168.2.x, Gateway: 192.168.2.1

### 3. Verify Connectivity with Ping

1. Open PC → Desktop → Command Prompt.

2. Test different responses:

- Ping reply → reachable IP
- Request timed out → device powered off / link down
- Destination unreachable → wrong gateway or missing route

3. Observe the output for each case.

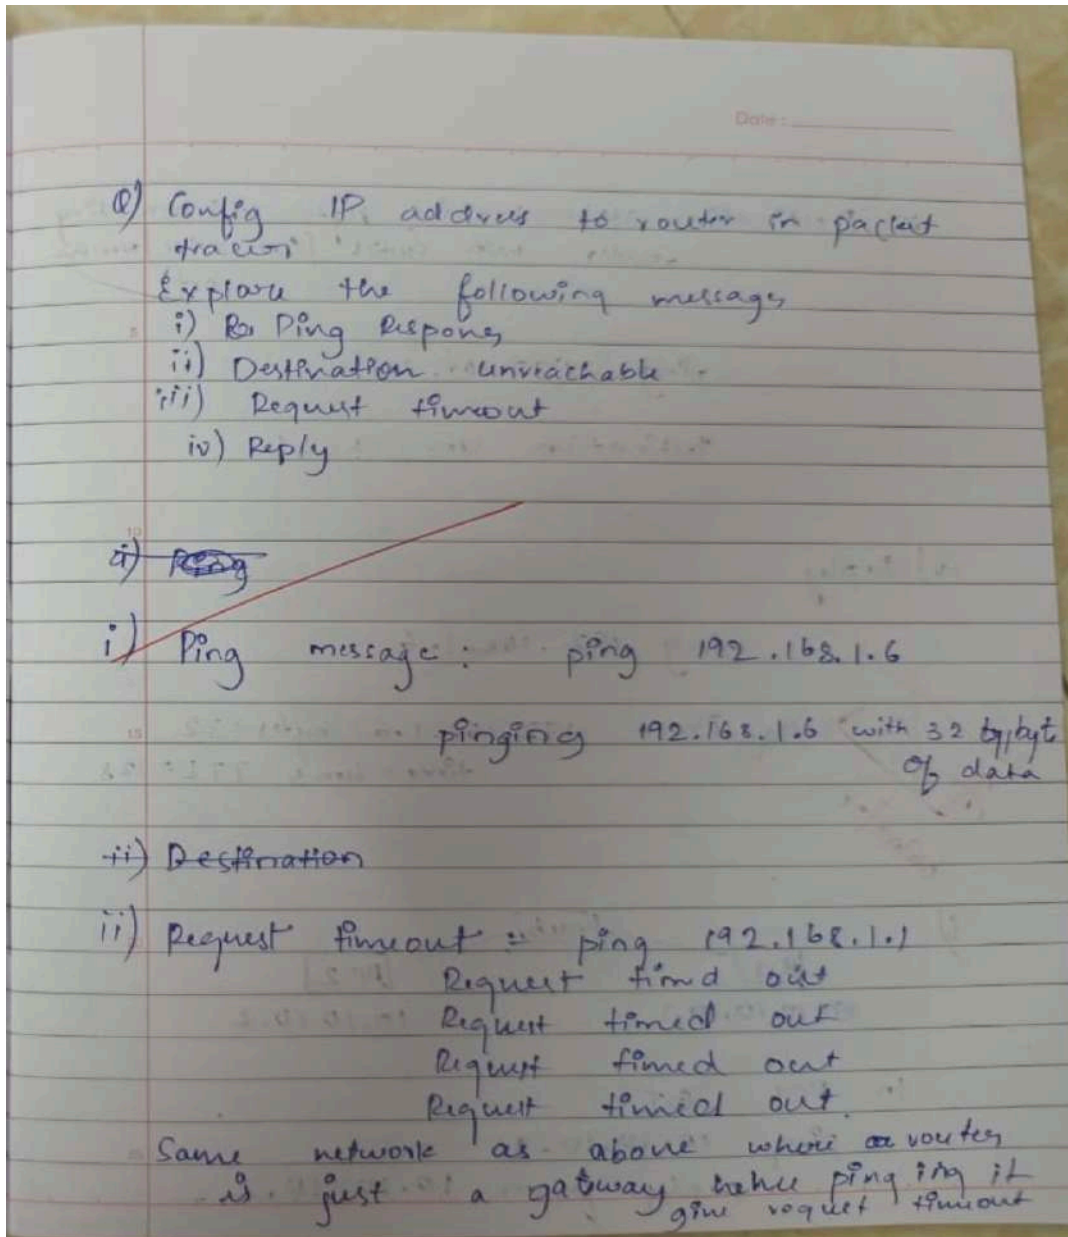

Example commands:

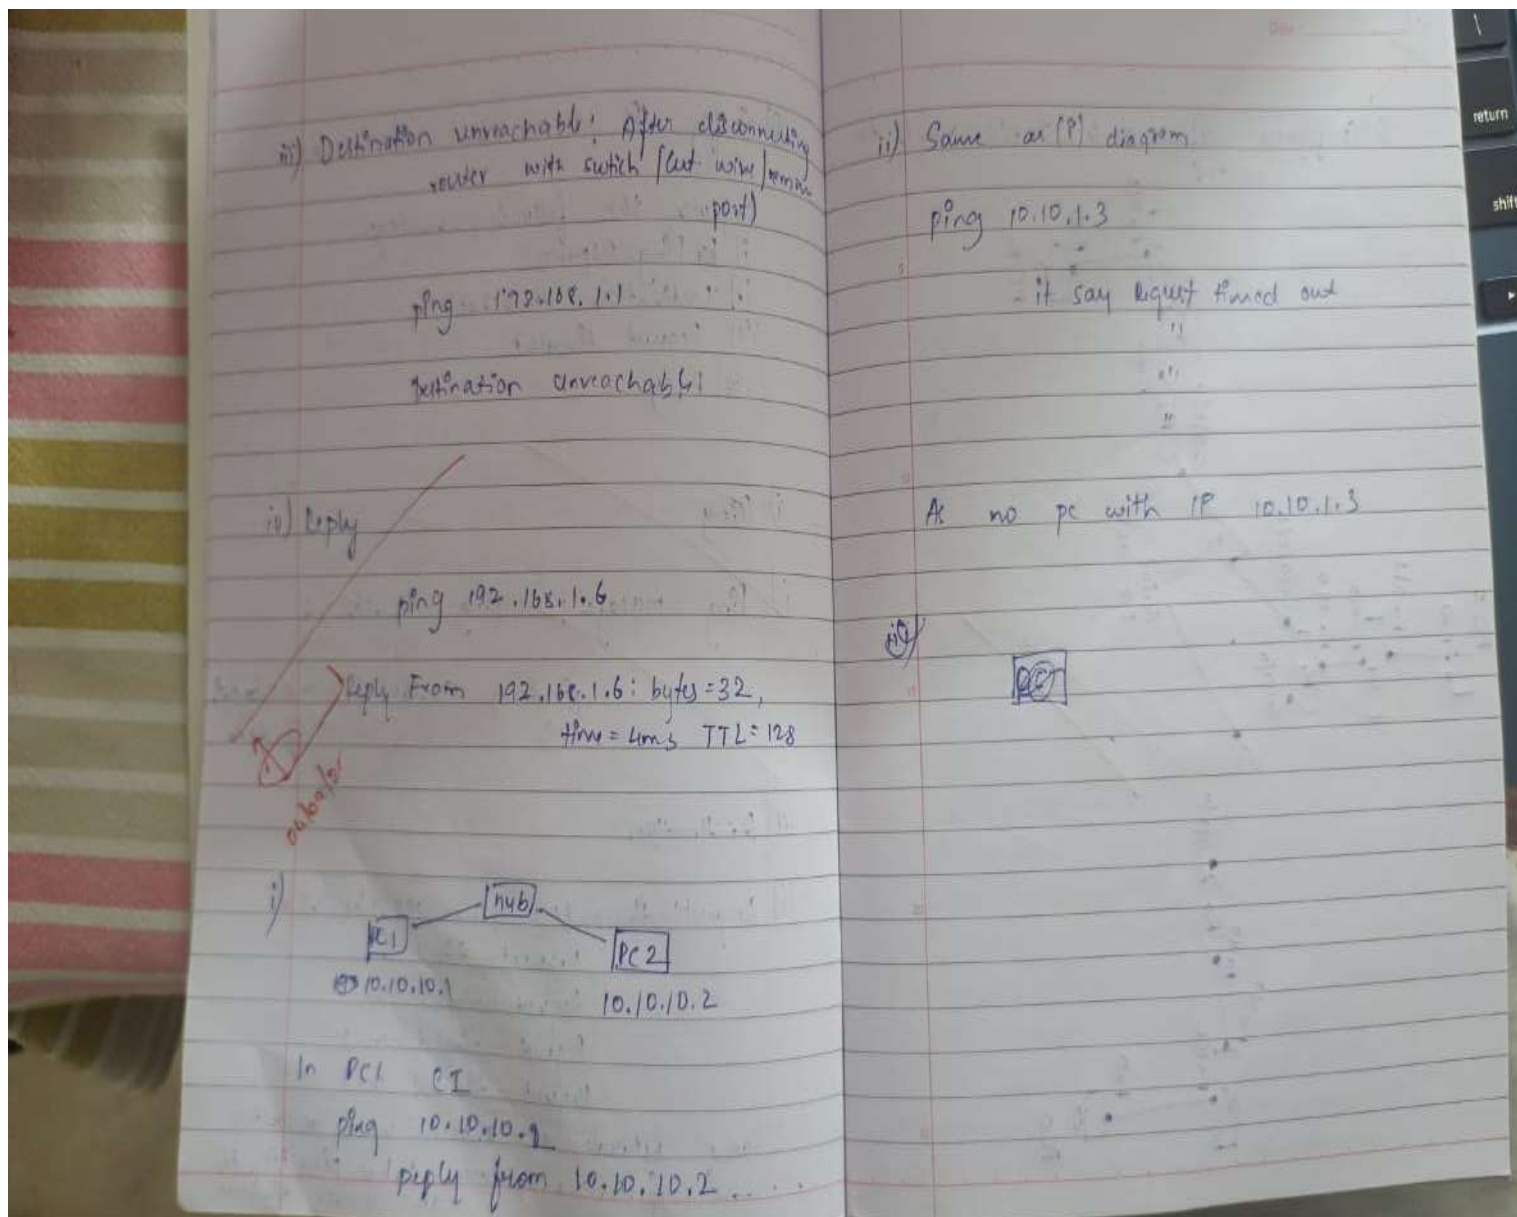

ping 192.168.1.2

ping 192.168.1.101

ping 192.168.2.200

### Observation:

Output:

```

PC0
Physical Config Desktop Programming Attributes
Command Prompt
Cisco Packet Tracer PC Command Line 1.0
C:\>ping 192.168.1.2
Pinging 192.168.1.2 with 32 bytes of data:
Request timed out.
Reply from 192.168.1.2: bytes=32 time<1ms TTL=128
Reply from 192.168.1.2: bytes=32 time<1ms TTL=128
Reply from 192.168.1.2: bytes=32 time<1ms TTL=128
Ping statistics for 192.168.1.2:
    Packets: Sent = 4, Received = 3, Lost = 1 (25% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 1ms, Average = 0ms
C:\>ping 192.168.1.101
Pinging 192.168.1.101 with 32 bytes of data:
Reply from 192.168.1.101: bytes=32 time<1ms TTL=128
Reply from 192.168.1.101: bytes=32 time<1ms TTL=128
Reply from 192.168.1.101: bytes=32 time<1ms TTL=128
Reply from 192.168.1.101: bytes=32 time<1ms TTL=128
Ping statistics for 192.168.1.101:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms

    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
C:\>
  
```

## **Program 5:**

**Aim:** Configure default route, static route to the Router.

### **Topology:**

### **Procedure:**

#### **1. Assign IP Addresses**

1. On each router → Config → Interfaces
2. Set IP addresses for all FastEthernet and Serial interfaces according to the network diagram.
3. Turn Port Status = On for each interface.

#### **2. Configure Static Routes**

Perform on each router:

Router 2

1. Go to Config → Routing → Static
2. Add routes for networks behind Router 3 and Router 4:
  - o Network: 192.168.3.0 /24 → Next Hop: 192.168.4.2
  - o Network: 192.168.5.0 /24 → Next Hop: 192.168.4.2
  - o Network: 192.168.6.0 /24 → Next Hop: 192.168.4.2
  - o Network: 192.168.7.0 /24 → Next Hop: 192.168.4.2

Router 3

1. Go to Config → Routing → Static
2. Add routes toward Router 2 and Router 4:
  - o 192.168.1.0 /24 → via 192.168.4.1
  - o 192.168.2.0 /24 → via 192.168.4.1
  - o 192.168.5.0 /24 → via 192.168.7.2
  - o 192.168.6.0 /24 → via 192.168.7.2

Router 4

1. Go to Config → Routing → Static
2. Add routes toward Router 2 and Router 3:
  - o 192.168.1.0 /24 → via 192.168.7.1

- 192.168.2.0 /24 → via 192.168.7.1
- 192.168.3.0 /24 → via 192.168.7.1
- 192.168.4.0 /24 → via 192.168.7.1

### 3. Configure Default Route (Optional)

If needed, add:

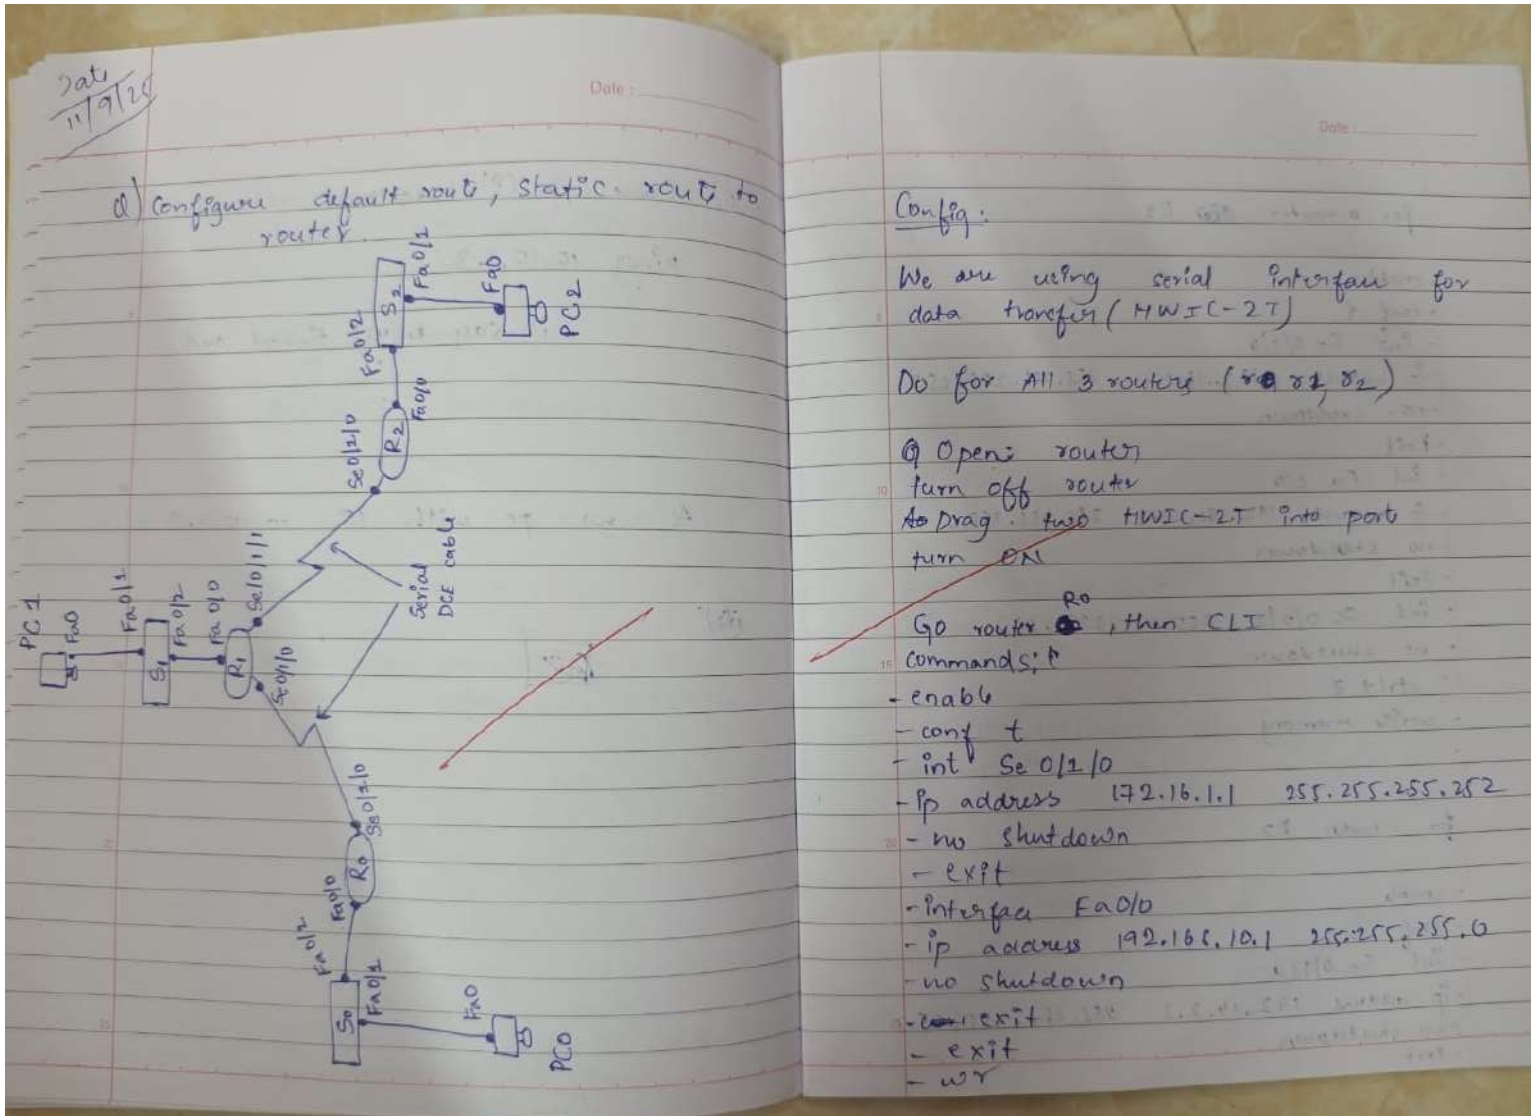

0.0.0.0 /0 → next-hop IP

(from each router toward the main/central router)

### 4. Test Connectivity

1. On any PC → Command Prompt
2. Use ping to reach devices in other networks.
3. Successful reply = routing configured correctly.

### Observation

## Output:

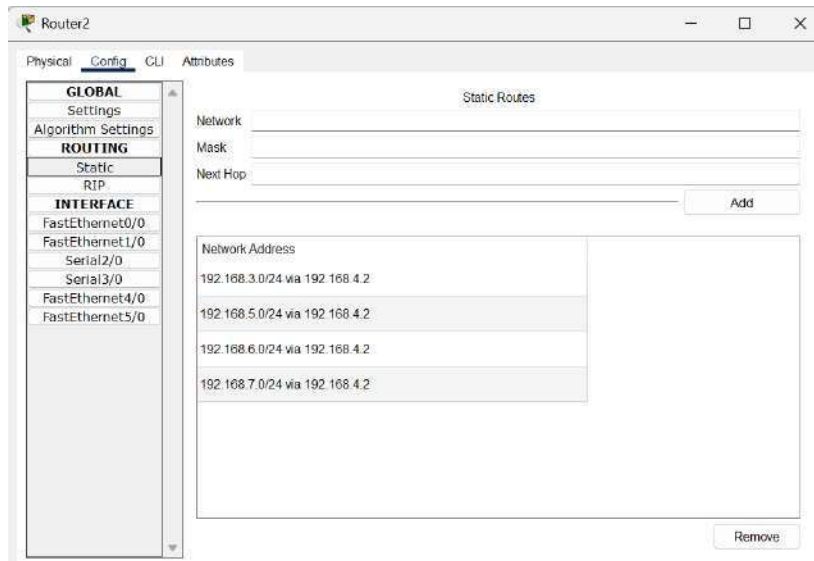

Fig 1. Router 2 – Static routing

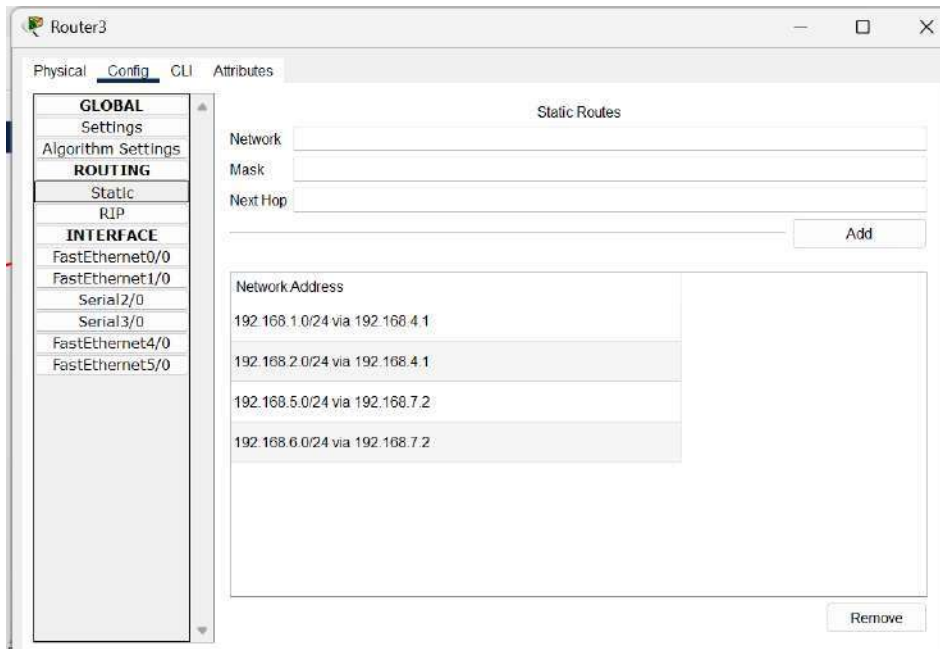

Fig 2. Router 3 – Static routing

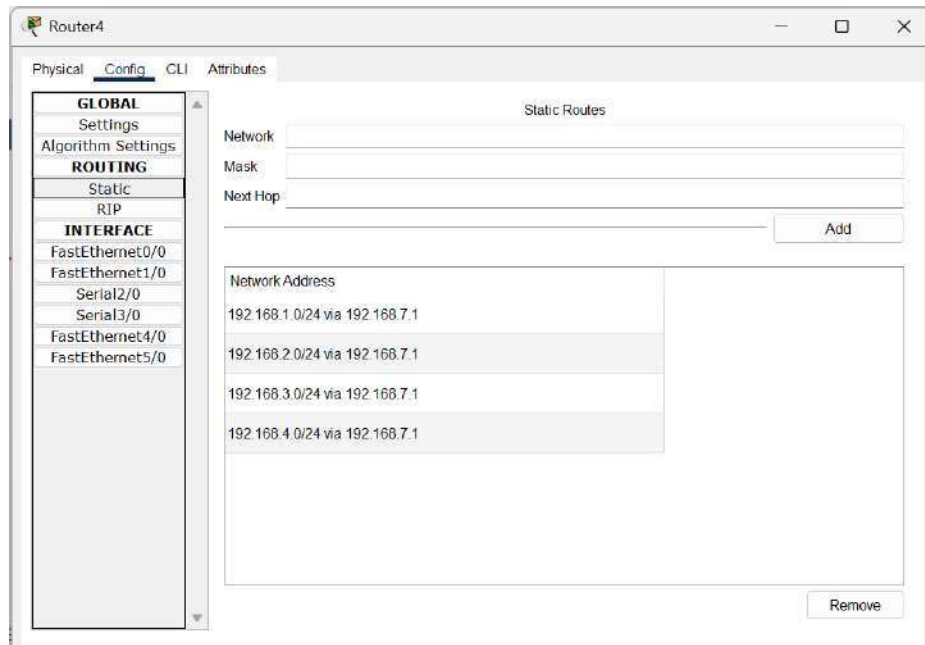

Fig 3. Router 4 – Static routing

## Program 6:

**Aim:** Configure RIP routing Protocol in Routers.

## Topology:

## Procedure

## 1. Assign IP Addresses

1. On each router → Config → Interfaces
2. Configure IPs for all FastEthernet and Serial interfaces as per the network diagram.
3. Turn Port Status = On.

## 2. Enable RIP on Each Router

Router 2

1. Go to Config → Routing → RIP
2. Add directly connected networks:
  - 192.168.1.0
  - 192.168.2.0
  - 192.168.4.0

Router 3

1. Go to Config → Routing → RIP
2. Add networks:
  - 192.168.3.0
  - 192.168.4.0
  - 192.168.7.0

Router 4

1. Go to Config → Routing → RIP
2. Add networks:
  - 192.168.5.0
  - 192.168.6.0
  - 192.168.7.0

### 3. Verify Routing

1. On any router → CLI
  2. Use:
  3. show ip route
- RIP routes should appear with the letter R.

### 4. Test Connectivity

1. From PCs across different networks, use:
2. ping <destination IP>
3. Successful replies confirm RIP routing is working.

### Observation

Date: 16/10/21

lab-6

1) Configure RIP routing protocol in routers

ip: 192.168.1.1 for Fa0/0

ip: 192.168.2.1 for Fa0/0

Serial DCE

ip: 192.168.1.2

gateway: 192.168.1.1

ip: 192.168.2.2

gateway: 192.168.1.1

R0 & R1 → generic router - PT

Add extra port PT-router - NM-1SS in both routers

Set ip address for both PCs (use diagram ip)

Same for both routers

config → Fa0/0 - ip: (From diagram)

RIP config

R0 → config → ~~Se 2/0~~ Se 2/0

set clock rate = 64000

ip = 10.10.0.2

port status = ON

R1 → config → Se 2/0

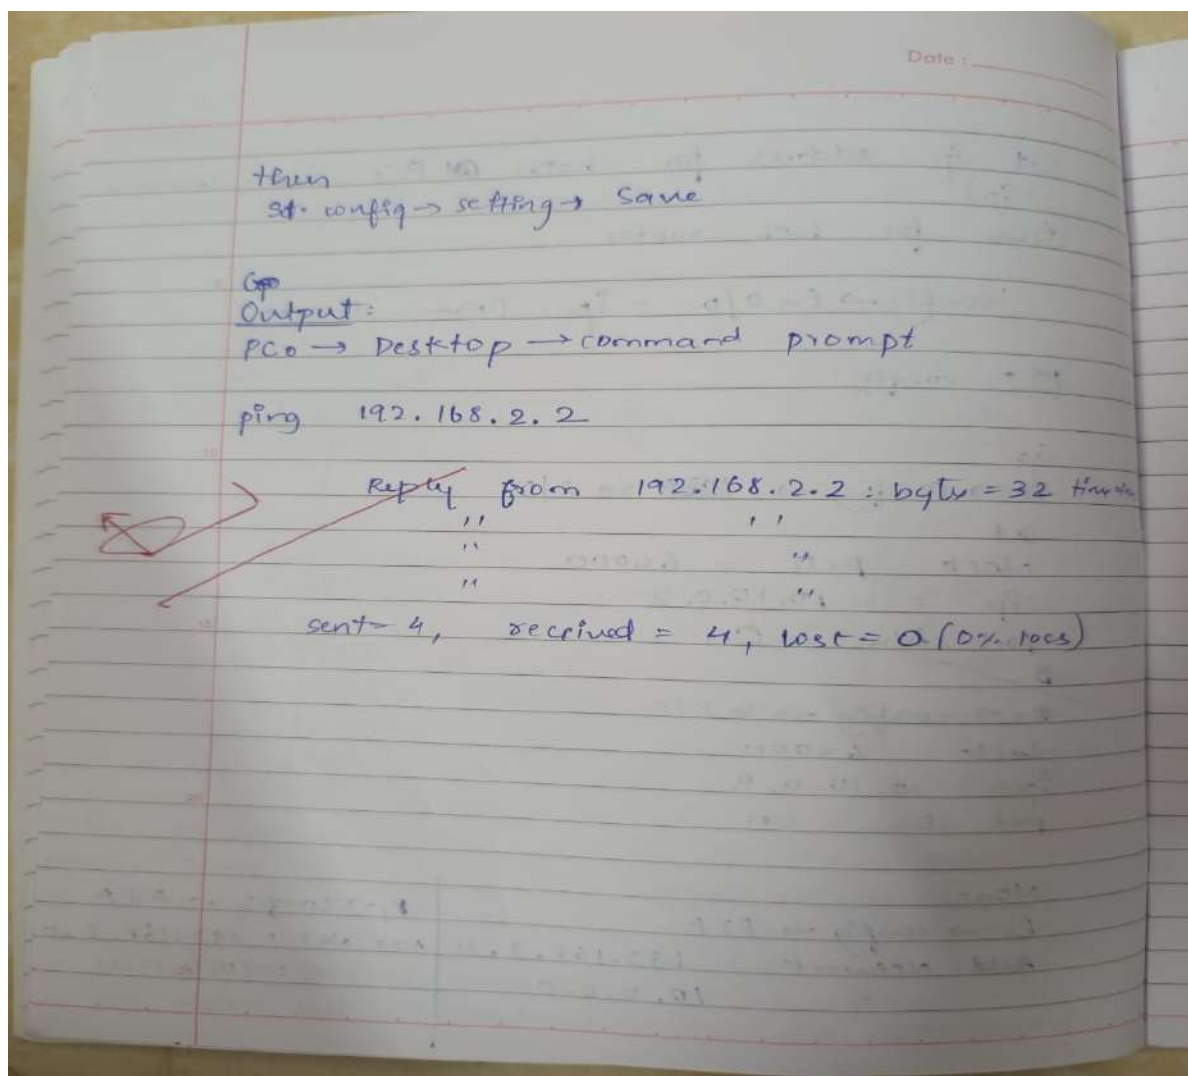

clock = 64000

ip = 10.10.0.3

port status = ON

Now

|                           |                      |
|---------------------------|----------------------|
| R0 → config → RIP         | R1 → config → RIP    |
| Add Network = 192.168.1.0 | Add Net: 192.168.2.0 |
| 10.0.0.0                  | 10.0.0.0             |

## Output:

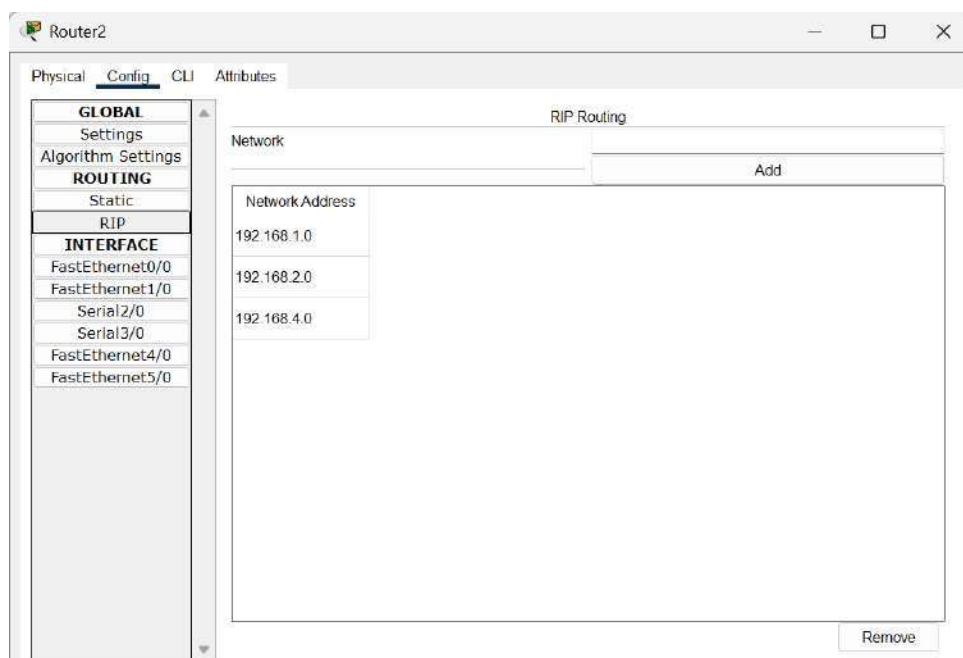

Fig 1. Router 2 – RIP routing

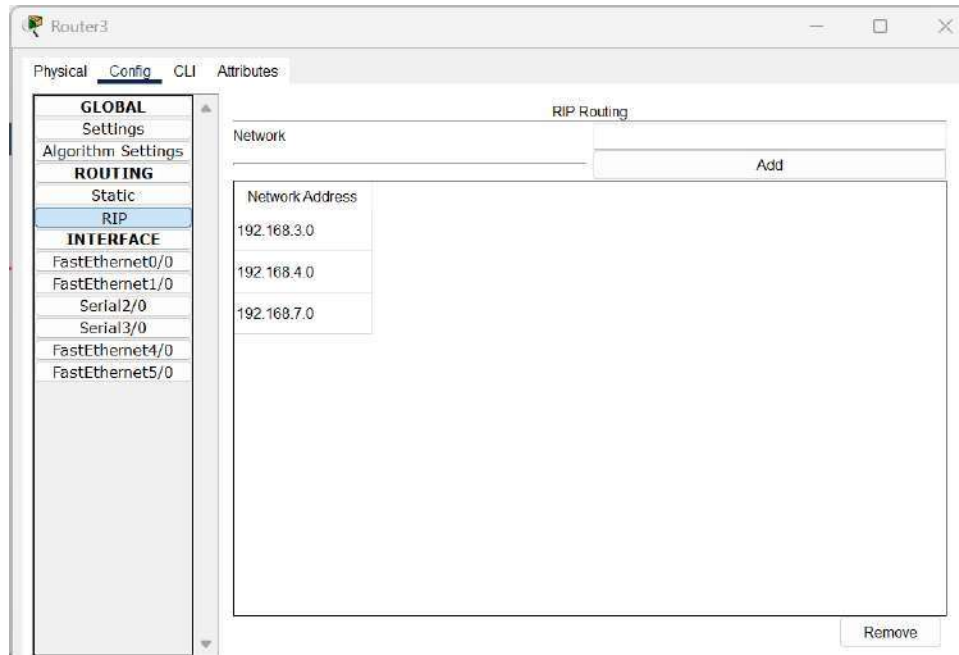

Fig 2. Router 3 – RIP routing

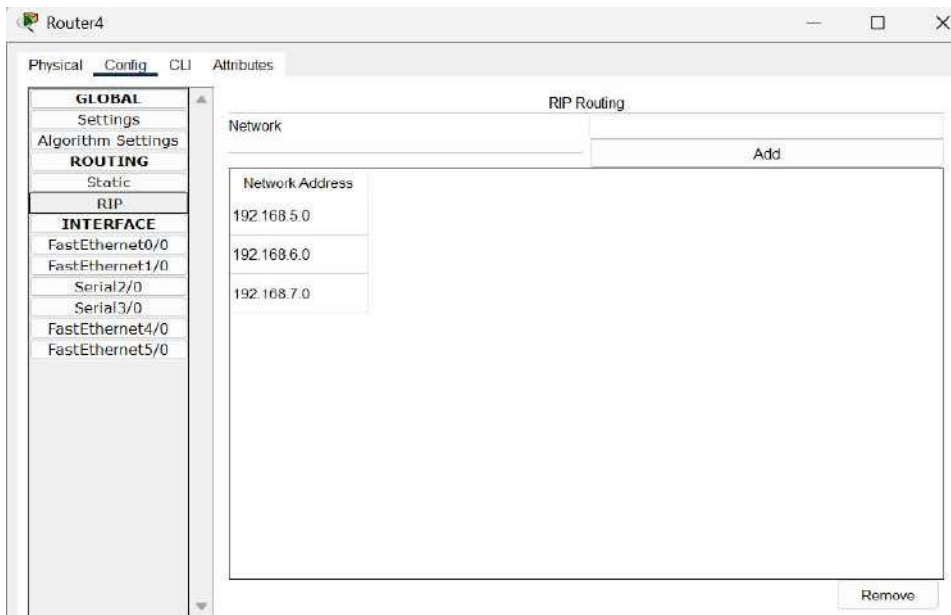

Fig 3. Router 4 – RIP routing

## **Program 7:**

**Aim:** Configure OSPF routing protocol.

### **Topology:**

### **Procedure:**

#### **1. Assign IP Addresses**

1. On each router → Config → Interfaces
2. Assign IPs to Gig0/0, Gig0/1, and PC-facing interfaces as per the diagram.
3. Enable all interfaces (Port Status = On).

#### **2. Configure OSPF on All Routers**

Router 0

1. Go to Config → Routing → OSPF
2. Set Process ID = 1
3. Add networks:
  - 192.168.1.0 /24
  - 10.0.0.0 /30 (link to center router)

Router 1 (Center Router)

1. Process ID = 1
2. Add networks:
  - 10.0.0.0 /30 (left link)
  - 20.0.0.0 /30 (right link)

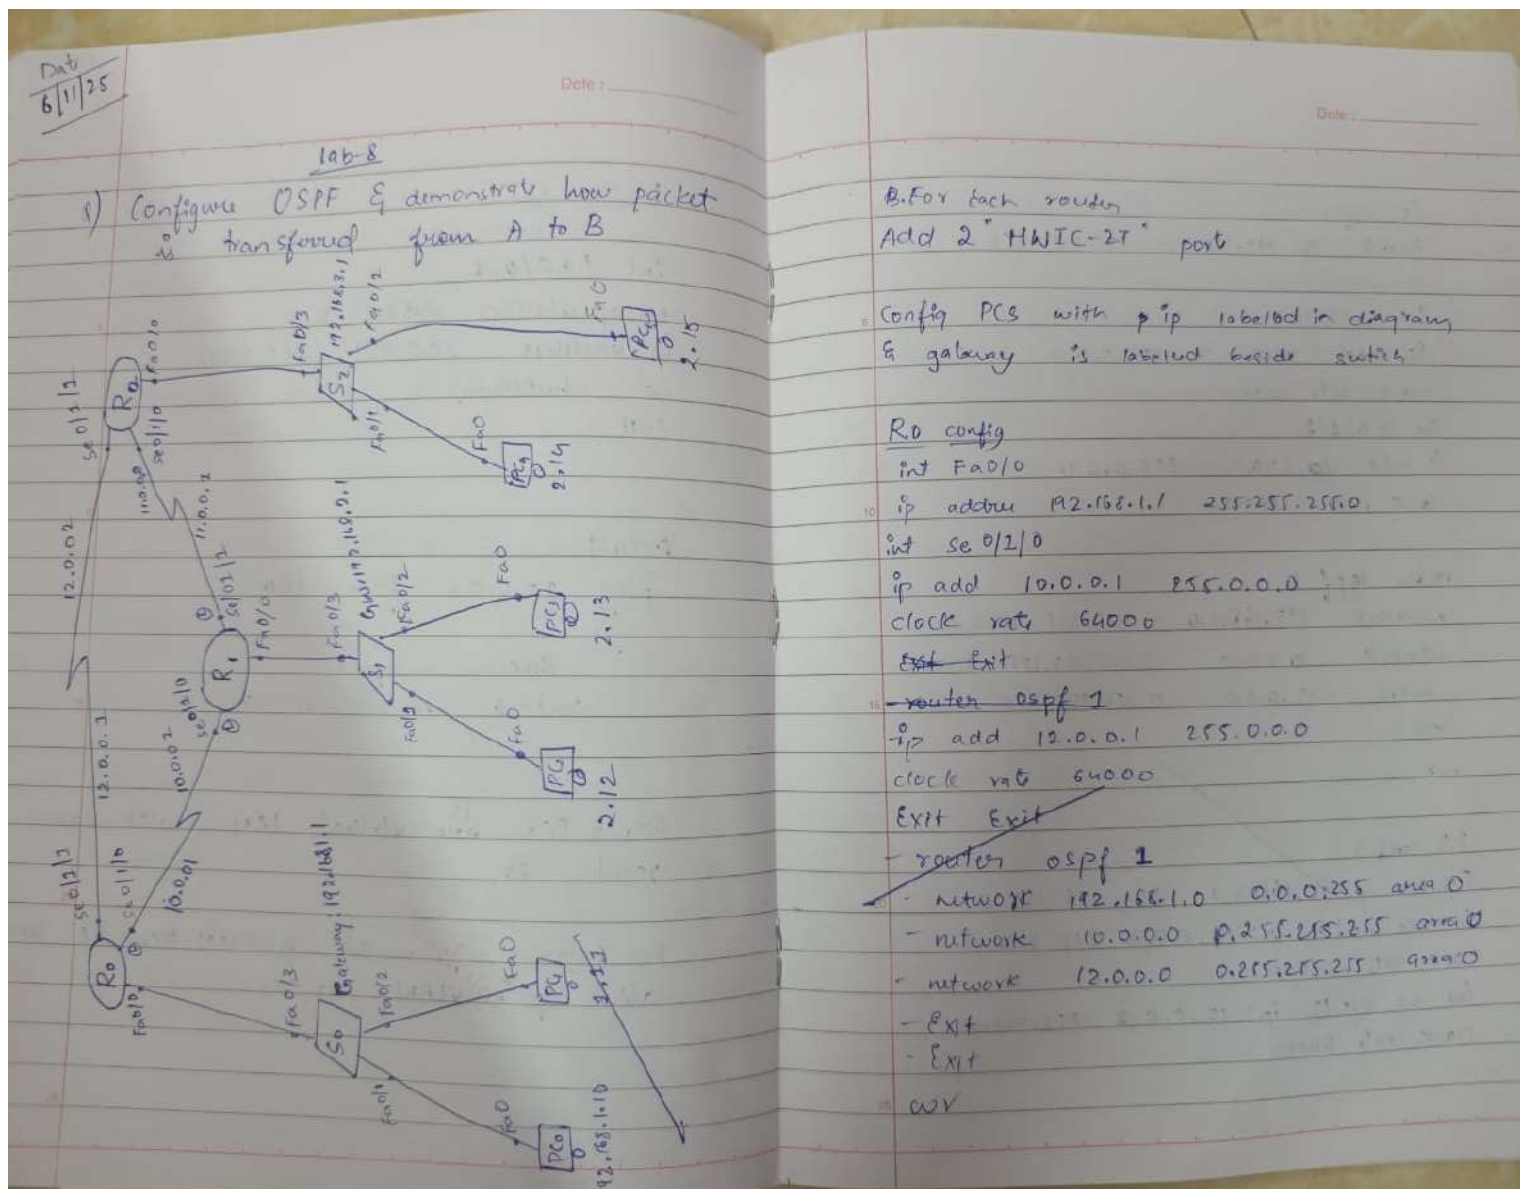

## Router 2

1. Process ID = 1
2. Add networks:
  - o 192.168.2.0 /24
  - o 20.0.0.0 /30 (link to center router)

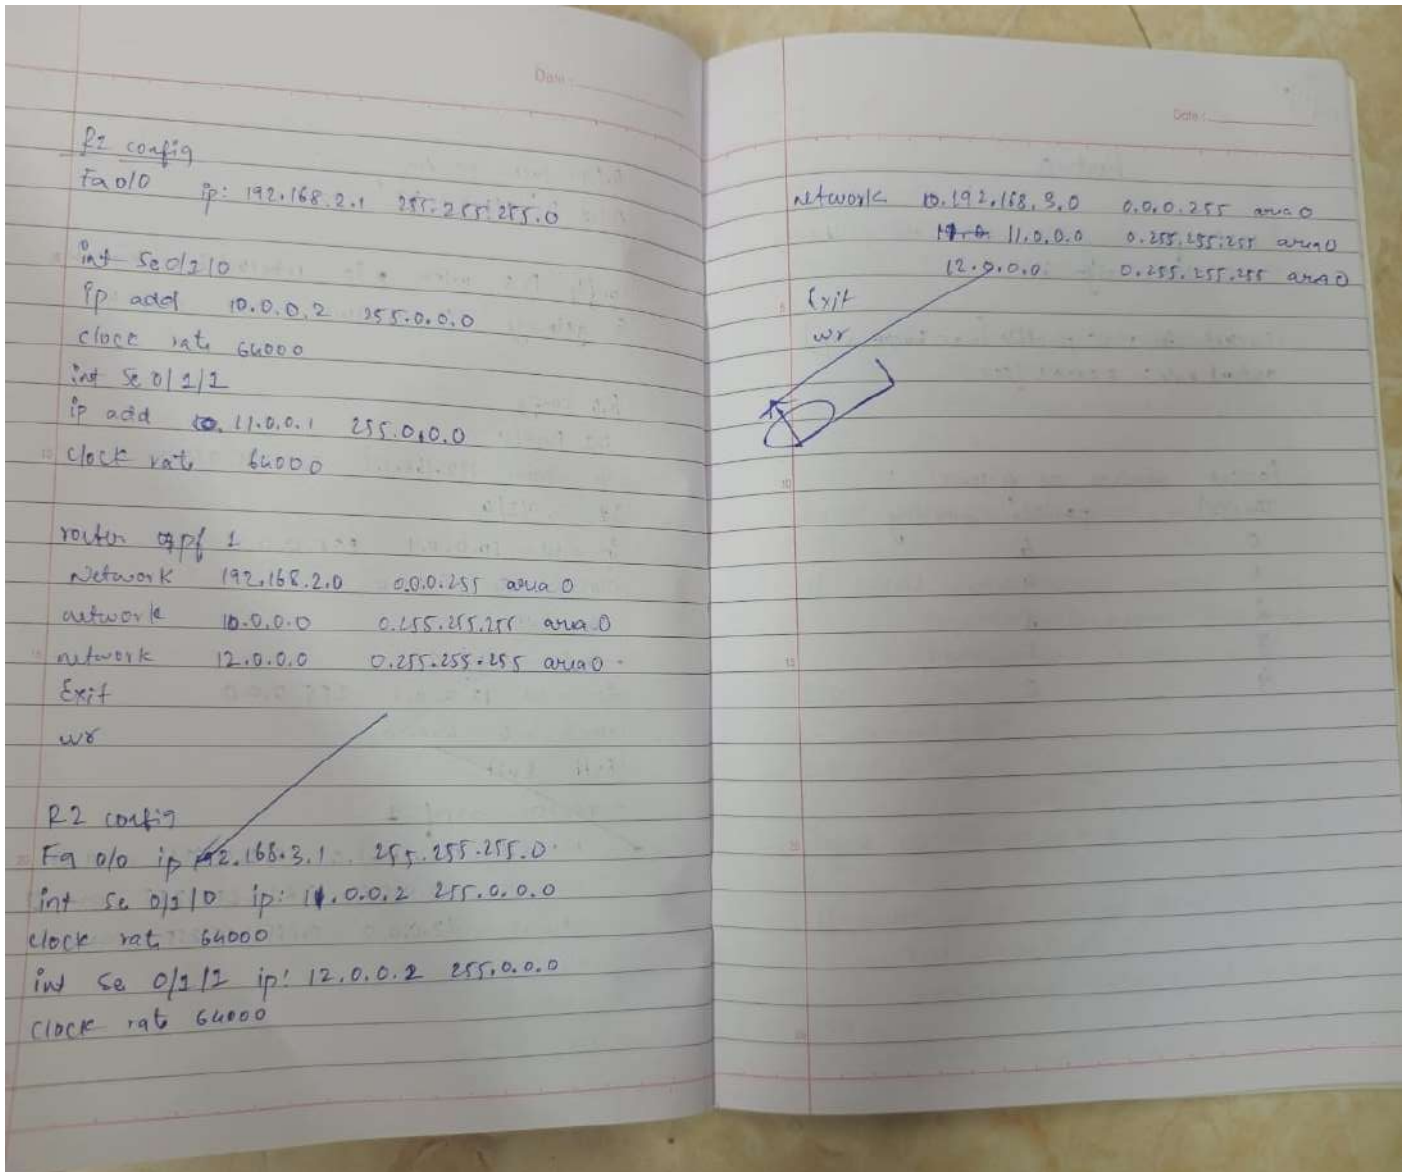

### 3. Test Connectivity

1. From PC0 → PC1, send PDU or use ping command.
2. Successful ICMP reply confirms OSPF is working.

### 3. Observation:

**Output:**

Fig 1. Sending PDU message from PC0 to PC1

| PDU List Window   |             |         |             |      |   |           |          |     |        |          |
|---|-------------|---------|-------------|------|---|-----------|----------|-----|--------|----------|
| Fire  | Last Status | Source  | Destination | Type | Color   | Time(sec) | Periodic | Num | Edit   | Delete   |
|  | Successful  | PC0     | PC1         | ICMP |  | 0.000     | N        | 0   | (edit) | (delete) |
|  | Successful  | PC0     | Router2     | ICMP |  | 0.000     | N        | 1   | (edit) | (delete) |
|  | Successful  | PC0     | Router0     | ICMP |  | 0.000     | N        | 2   | (edit) | (delete) |
|  | Successful  | Router0 | PC1         | ICMP |  | 0.000     | N        | 3   | (edit) | (delete) |
|  | Successful  | Router1 | PC1         | ICMP |  | 0.000     | N        | 4   | (edit) | (delete) |
|  | Successful  | Router1 | Router2     | ICMP |  | 0.000     | N        | 5   | (edit) | (delete) |

Fig 2. Checking PDU messages

## **Program 8:**

**Aim:** To construct a VLAN and make the PC's communicate among a VLAN.

### **Topology:**

### **Procedure:**

#### **1. Create VLANs on Both Switches**

1. Open each switch → Config → VLAN Database
2. Create VLANs (example):
  - VLAN 10
  - VLAN 20

#### **2. Assign Ports to VLANs**

Assign PCs to the required VLAN:

Switch 1 (Left Side)

- PC0 (Fa0/1) → VLAN 10
- PC1 (Fa0/2) → VLAN 10
- PC2 (Fa0/3) → VLAN 20

Switch 2 (Right Side)

- PC3 (Fa0/2) → VLAN 10
- PC4 (Fa0/3) → VLAN 10
- PC5 (Fa0/4) → VLAN 20

### 3. Configure Trunk Between Switches

1. Select the link between Fa0/4 (Switch1) ↔ Fa0/1 (Switch2)
2. On both ends → Config → Interface
3. Set Mode = Trunk
4. Allow VLANs 10 and 20 on the trunk.

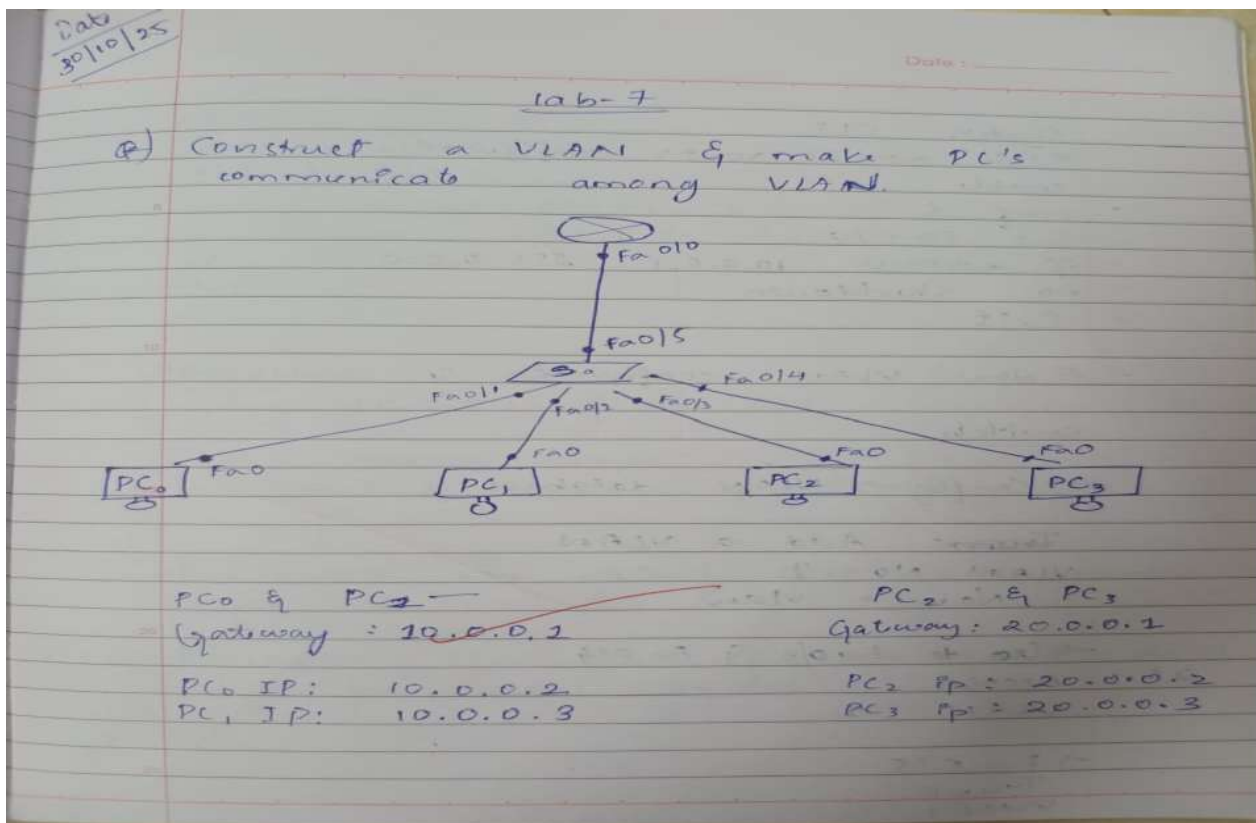

### 4. Assign IPs to PCs

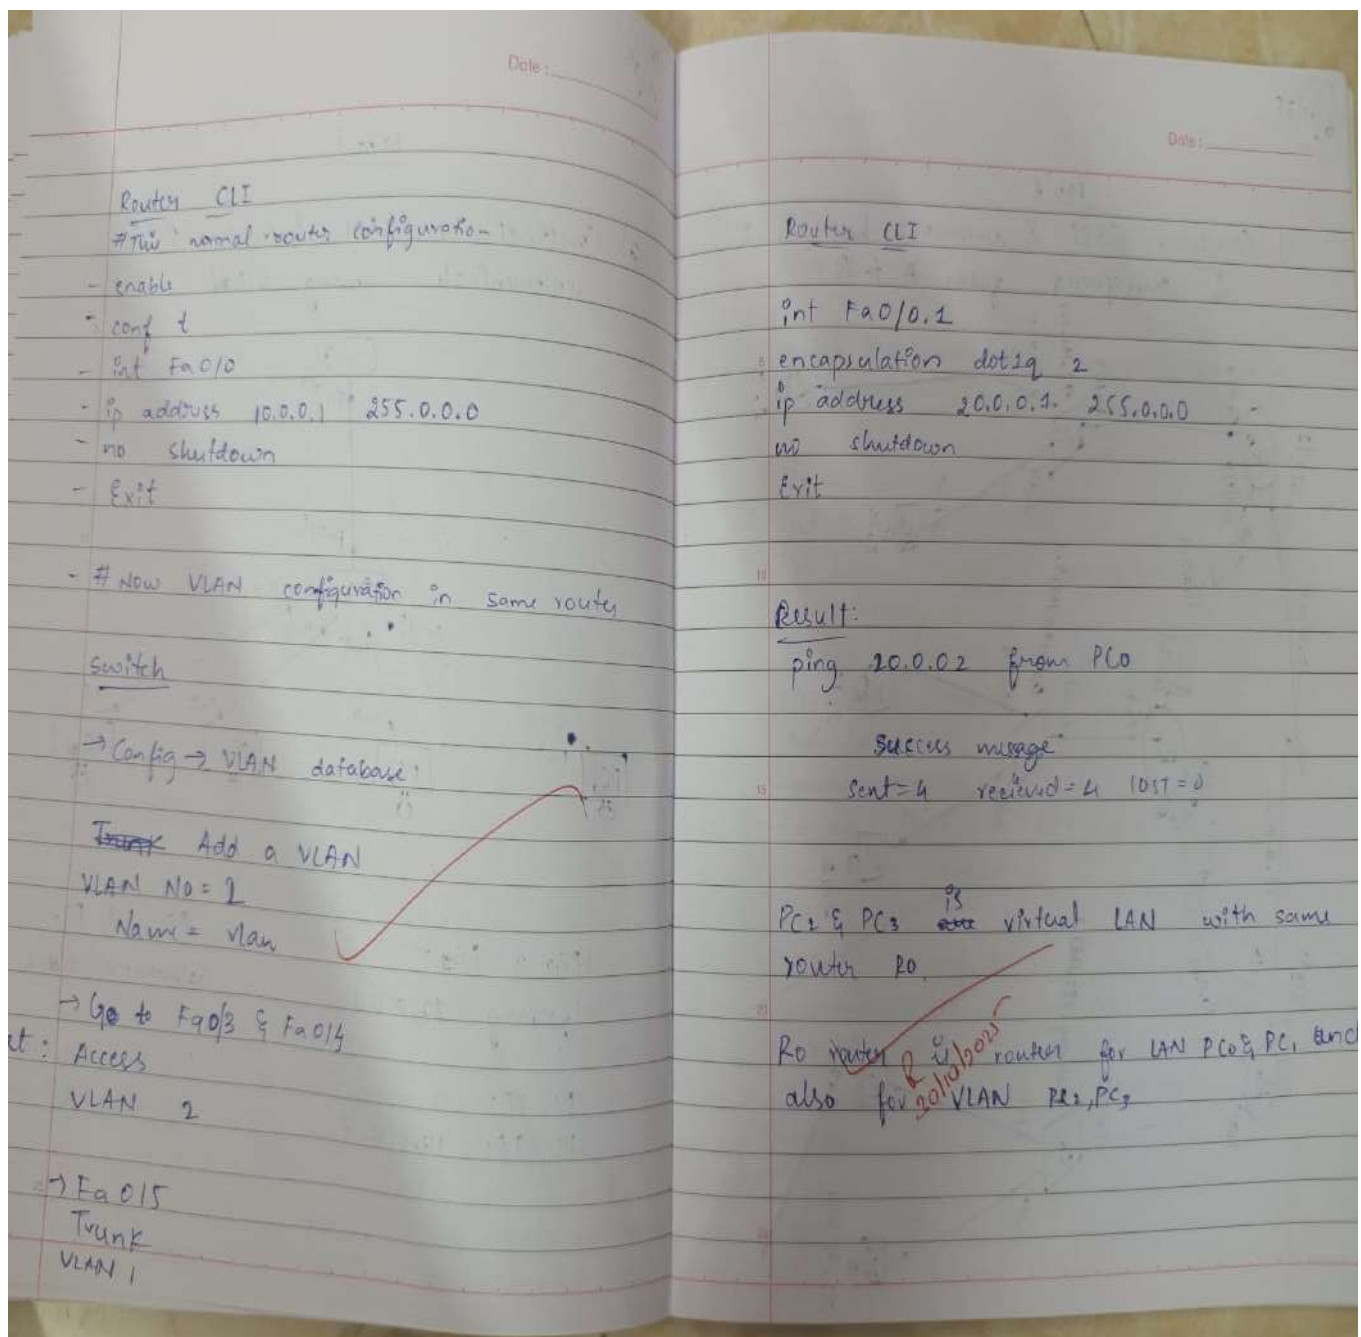

1. On each PC → Desktop → IP Configuration
2. Assign IPs in VLAN-specific networks (example):
  - VLAN 10 → 192.168.10.x
  - VLAN 20 → 192.168.20.x

### 5. Test Connectivity

1. Use Add Simple PDU or ping:
  - Devices in the *same* VLAN should communicate.
  - Devices in *different* VLANs should not communicate.

### Observation:

## Output:

Fig 1. Sending PDU message from PC0 to PC5

| PDU List Window   |             |        |             |      |   |           |          |     |        |          |
|---|-------------|--------|-------------|------|---|-----------|----------|-----|--------|----------|

Fig 2. Checking PDU messages

## **Program 9:**

**Aim:** To construct a WLAN and make the nodes communicate wirelessly.

### **Topology:**

Configuration 1

Configuration 2

### **Procedure:**

#### **1. Add Wireless Devices**

1. Place Wireless Router, Access Point, Laptops, Smartphones, and PCs as shown.
2. For laptops/PCs without wireless modules →
  - Power off → Insert Wireless NIC → Power on.

#### **2. Configure Wireless Router / Access Point**

1. Click the Wireless Router / AP → Config → Wireless
2. Set:
  - SSID = BMSCE
  - Authentication = WPA2-PSK
  - Passphrase = bmsce123
3. Keep channel and encryption default.

#### **3. Configure Wireless Settings on Laptop & Smartphone**

1. Open device → Desktop → PC Wireless / Wi-Fi
2. Select SSID BMSCE
3. Enter password bmsce123
4. Connect.

#### **4. Assign IP Addresses (if required)**

1. Use DHCP (automatic) or manually assign from the same network.

#### **5. Test Wireless Communication**

1. Use Add Simple PDU or ping between wireless devices.
2. Successful replies confirm WLAN communication.

## Observation:

1) To construct a WLAN & make the nodes communicate wirelessly.

Smartphone is always on ~~wifi mode~~ wireless mode

When we place wireless router & smartphone, it is SP automatically connects to Ro wirelessly

~~Laptop & PC are in ethernet mode by default~~

Go Laptop → physical -

Turn off  
drag out ethernet port  
drag in wifi port  
Turn ON

PC

same as laptop

Once we do this LAP & PC are also wirelessly connected to Ro

This Open network

\* ~~Not Closed WLAN~~

go to router → config → Wireless

SSID: bmsce {wife name}

Authentication: WPA2-PSK

Pass phrase: bms12345

~~Once we do this all three devices get disconnected~~

To connect (For all three)

device → config → Wireless

SSID - bmsce

pass - bms12345

can be  
Send message

Message can be sent from any device to other

## Output:

### 1. Do Physical Connections In:

- Laptop
- PC

Fig 1.1 Step1: Turn off light / Power off laptop

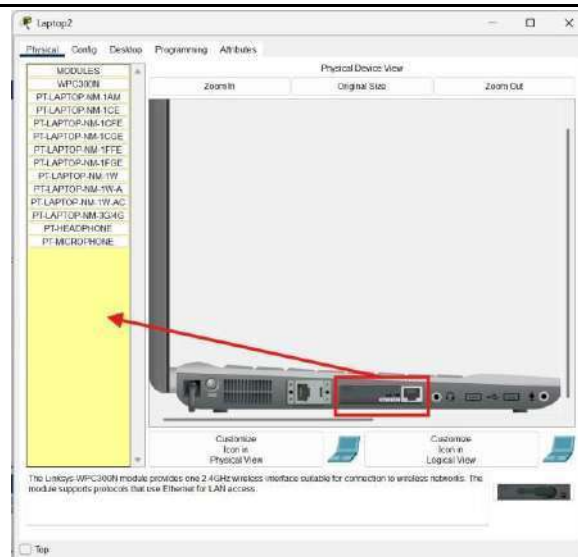

Fig 1.2 Step2: Drag and Drop the Ethernet into pointed location

Fig 1.3 Step3: Drag and Drop the device into pointed location and Turn on light/Laptop

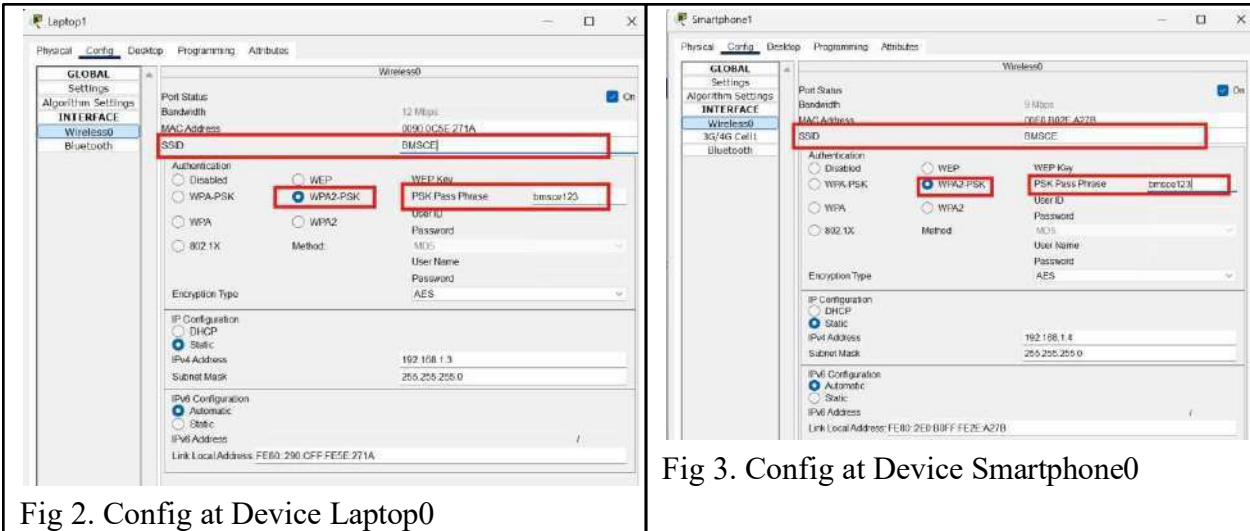

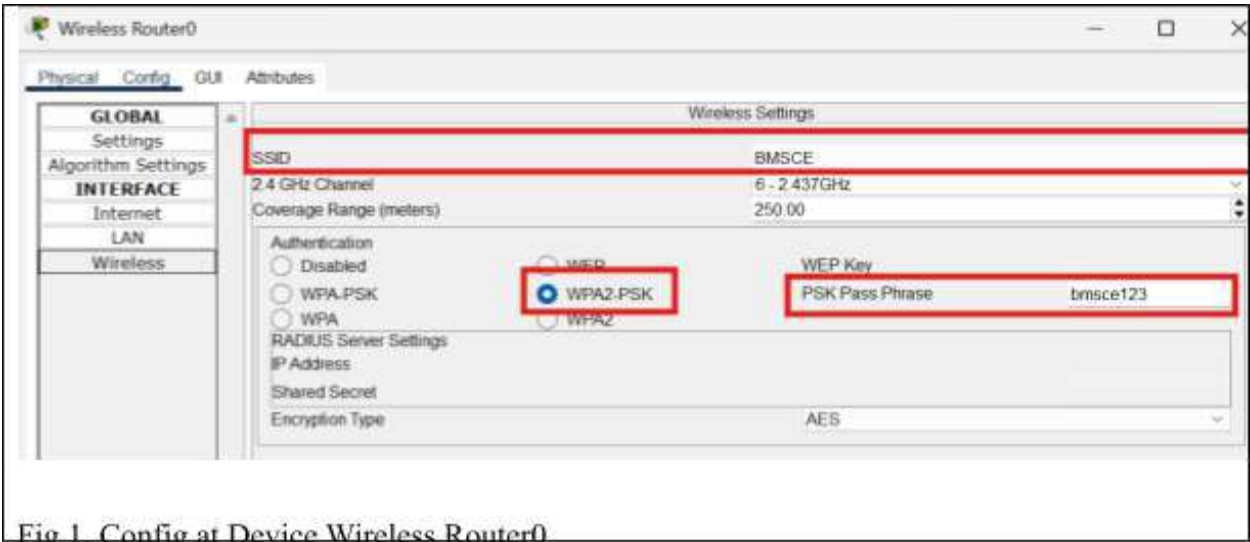

Fig 2. PC physical connection (combined 3 steps)

2. Do Wireless Connection in:

| PDU List Window |             |          |             |      |       |           |          |     |        |

Fig 3. Checking PDU messages

## **Program 10:**

**Aim:** Demonstrate the TTL/ Life of a Packet.

### **Topology:**

### **Procedure:**

#### **Create the Network**

1. Place one Router, one Switch, and two PCs as shown in the topology.
2. Connect:
  - Router → Switch (Fa0/0 to Fa0/1)
  - Switch → PC0 (Fa1/1)
  - Switch → PC1 (Fa2/1)

#### **2. Assign IP Addresses**

1. On each PC → Desktop → IP Configuration
  - PC0: 192.168.1.2 /24
  - PC1: 192.168.1.3 /24
  - Gateway: 192.168.1.1
2. On Router → Config → Interface Fa0/0
  - IP: 192.168.1.1 /24
  - Turn Port Status = On

### **3. Switch to Simulation Mode**

1. Click Simulation Mode (bottom right).
2. Select Add Simple PDU tool.

### **4. Send the Packet**

1. Click PC0 → then click PC1 to send an ICMP (ping) PDU.
2. Observe packet movement step-by-step.

### **5. Check TTL (Time To Live)**

1. Click the PDU in the event list.
2. Open Inbound PDU Details and Outbound PDU Details.
3. Note the TTL value:
  - At source PC → TTL usually starts at 255
  - After passing Router → TTL reduces (example: 128)

### **6. Observe TTL Decrement**

Each time a packet passes through a router, TTL decreases by 1, demonstrating the packet's lifespan on the network.

## Observation:

Q) Construct simple LAN & understand the concept and operation of ARP (address resolution protocol)

- ARP is used to map IP address to a MAC address
- ARP is used to get data link layer address MAC address with the help of IP address

Configure IP address for all three PCs & server.

select inspect  
open ARP table for PC0 & server

- Initially both tables are empty-

go to PC0 → Command  
ping 192.168.11.4 (server ip)

success message

After pinging

in ARP table - we can see one entry for each.

PC ARP

| IP           | hardware add   | Interface |
|--------------|----------------|-----------|
| 192.168.11.4 | 0002.1970.463C | Fa0       |

Server ARP

| ip           | hardware       | Interface |
|--------------|----------------|-----------|
| 192.168.11.1 | 0030.A328.6D50 | Fa0       |

Conclusion: Once PDU sent first time MAC address of destination fetched along response PDU.

## Output:

**PDU Information at Device: PC1**

OSI Model: **Inbound PDU Details** | Outbound PDU Details

Fig 1. Outbound PDU Details at Device PC1

## **Program 11:**

**Aim:** To understand the operation of TELNET by accessing the router in server room from a PC in IT office.

### **Topology:**

### **Procedure:**

#### **Procedure**

##### **1. Configure the Router for Telnet**

1. Open Router0 → CLI and enter:
2. enable
3. configure terminal
4. hostname R1
5. line vty 0 4
6. login
7. password cisco
8. enable secret tp
9. interface fa0/0
10. ip address 192.168.1.1 255.255.255.0
11. no shutdown
12. exit
13. end
14. Verify interface status:
15. show ip interface brief

## **2. Assign IP to PC**

1. On PC0 → Desktop → IP Configuration:
  - IP Address: 192.168.1.2
  - Subnet Mask: 255.255.255.0
  - Gateway: 192.168.1.1

## **3. Test Connectivity**

1. On PC0 → Command Prompt, ping the router:
2. `ping 192.168.1.1`

## **4. Access Router Using Telnet**

1. On PC0 → Command Prompt:
2. `telnet 192.168.1.1`
3. Enter password: cisco to log in.
4. You now have remote access to the router.

## **5. Verify Telnet Access**

1. Execute any router command remotely, e.g.:  
`show ip interface brief`

## Observation:

Date: 7/10/2022

LAB-5

1) Configure telnet to access server/router remotely

- telnet is used to access remote server/router and it is a simple command line tool that runs on your computer and it allows you to send commands remotely to a server and administrator
- telnet is also used to manage other devices like routers, switch and also to check if ports are open or close

router 0 config:

go to CLI

- enable

- conf t

- hostname R1

- enable secret rp

- int Fa 0/0

- ip address 192.168.1.1

- no shutdown

(Remaining #. to R2)

(rp is variable name)

(Interface on router side)

255.255.255.0

(router ip)

config

(virtual environment with range 0.5)

- line vty 0 5

- login

- password tp

- exit

- exit

- wr

(pass set as tp)

- show ip interface brief — command to show all interface status

Now we go for R1 router Fa 0/1 is idle we set ip for it from PC0

PC0 → command prompt

ping 192.168.1.1 (router ip)

(successful message)

- telnet 192.168.1.1

- password : tp

R1 > enable

Pass : tp

R1 # conf t

- int fa 0/1

- ip address 192.168.1.4 255.255.255.0

- do show ip interface brief

(you should see Fa 0/1 assigned ip 192.168.1.4)

Add an extra PC connected to switch

PC1 config

ip 192.168.1.5

gateway 192.168.1.1

PC2 → Command prompt

- telnet 192.168.1.1

- pass : tp

R2 > enable

pass : tp

R2 # conf t

- int fa 0/1

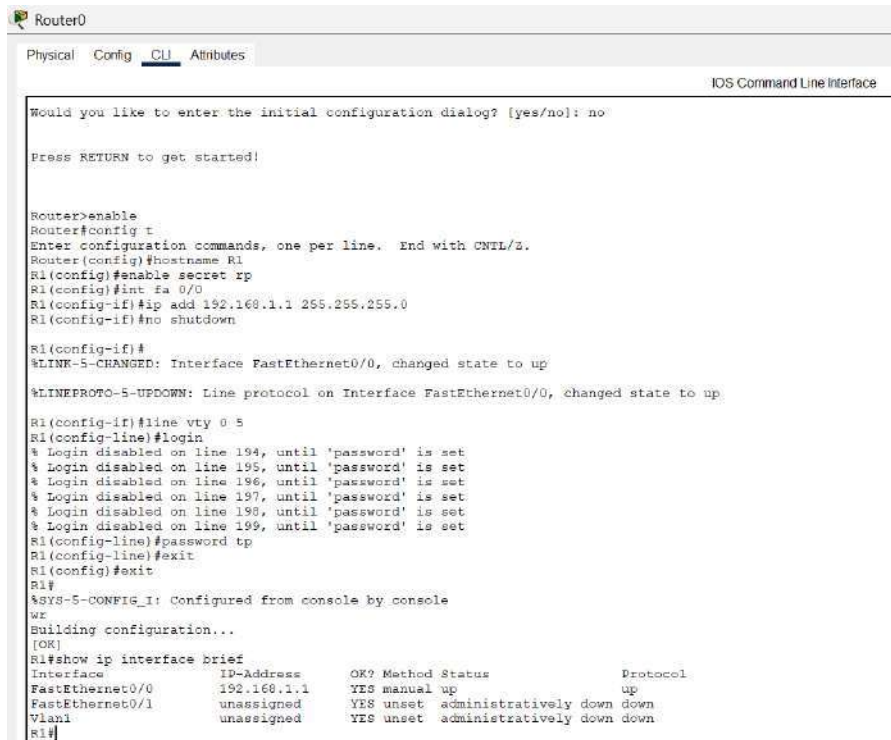

- ip address 192.168.1.8 255.255.255.0

- do show ip interface brief

(you see Fa 0/1 reassigned to 192.168.1.8)

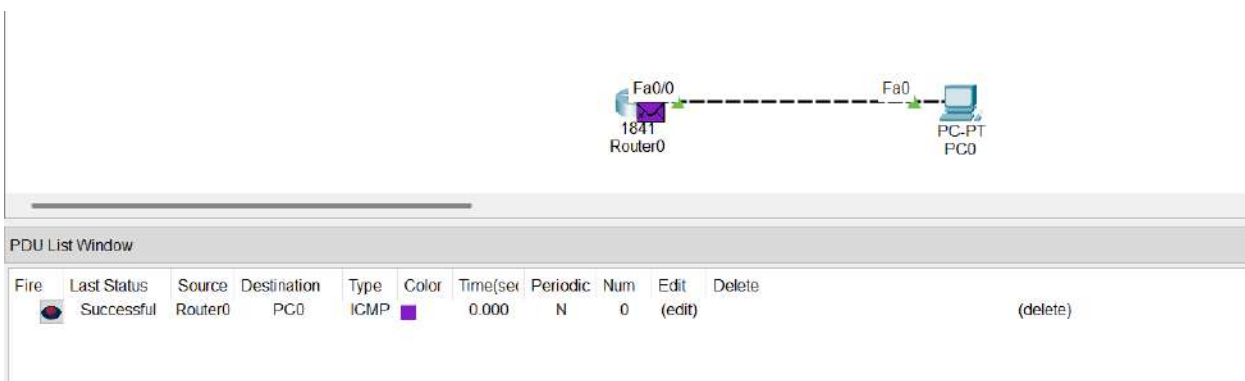

Fig 4. PDU message Successful

## **Program 12:**

**Aim:** To construct simple LAN and understand the concept and operation of Address Resolution Protocol (ARP).

### **Topology:**

### **Procedure:**

#### **1. Create the LAN**

1. Place one server, one switch, and three PCs as shown.
2. Connect all devices to the switch using straight-through cables.

#### **2. Assign IP Addresses**

1. On each PC and the Server → Desktop → IP Configuration
  - Server: 192.168.1.1
  - PC0: 192.168.1.2
  - PC1: 192.168.1.3
  - PC2: 192.168.1.4
  - Subnet Mask: 255.255.255.0
  - Gateway: (none needed for LAN)

#### **3. Check ARP Table (Before Communication)**

1. On each device → Command Prompt
2. Type:
3. `arp -a`
4. The ARP table will be empty initially.

#### **4. Generate Traffic (Ping)**

1. On PC0 → Command Prompt:
2. `ping 192.168.1.1`

3. PC0 sends an ARP request → switch → server.
4. Server replies with its MAC address.

### 5. Check ARP Table (After Communication)

1. On each device, again run:
2. `arp -a`
3. Entries now appear showing:
  - IP Address
  - MAC Address
  - Interface

This demonstrates how ARP resolves IP → MAC mapping.

### Observation:

Q) Construct simple LAN & understand the concept and operation of ARP (address resolution protocol)

- ARP is used to map IP address to a MAC address
- ARP is used to get data link layer address (MAC address) with the help of IP address

configure IP address for all three PCs & servers.

select inspect  
open ARP table for PC0 & server

Initially both tables are empty-

go to PC0 → Command  
ping 192.168.11.4 (server IP)

success message

After pinging in ARP table - we can see one entry for each.

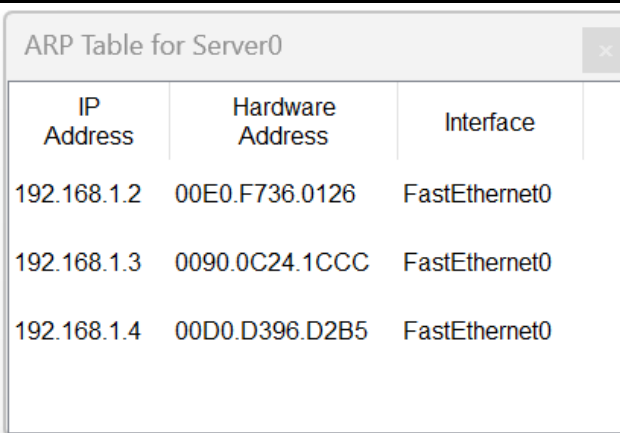

| PC0 ARP         | hardware add   | interface |
|-----------------|----------------|-----------|
| IP 192.168.11.4 | 0002.1770.4C3C | Fa0       |

| Server ARP      | hardware       | interface |
|-----------------|----------------|-----------|
| IP 192.168.11.1 | 0030.A328.6D50 | Fa0       |

Conclusion: Once PDU sent first time MAC address of destination fetched along response PDU.

## PART - B

### **Program 1:**

**Aim:** Write a program for congestion control using Leaky bucket algorithm.

### **Code:**

```
#include <stdio.h>

int min(int x, int y) {
    if (x < y)
        return x;
    else
        return y;
}

int main() {
    int drop = 0, mini, nsec, cap, count = 0, i, inp[25],
    process;

    printf("Enter the bucket size:\n");
    scanf("%d", &cap);

    printf("Enter the processing rate:\n");
    scanf("%d", &process);

    printf("Enter the number of seconds you want to
    simulate:\n");
    scanf("%d", &nsec);

    for (i = 0; i < nsec; i++) {
        printf("Enter the size of the packet entering at %d
        sec:\n", i + 1);
```

```

        scanf("%d", &inp[i]);
    }

    printf("\nSecond | Packet Received | Packet Sent | Packet
Left | Dropped\n");
    printf("-----\n");

    for (i = 0; i < nsec; i++) {
        count += inp[i];

        if (count > cap) {
            drop = count - cap;
            count = cap;
        }

        printf("%d\t %d\t\t", i + 1, inp[i]);

        mini = min(count, process);
        printf("%d\t\t", mini);

        count = count - mini;
        printf("%d\t\t %d\n", count,
drop);

        drop = 0;
    }

    // Remaining packets after time ends
    for (; count != 0; i++) {
        if (count > cap) {

```

```

        drop = count - cap;
        count = cap;
    }

    printf("%d\t 0\t\t", i + 1);

    mini = min(count, process);
    printf("%d\t\t", mini);

    count = count - mini;
    printf("%d\t\t %d\n", count,
        drop);

    drop = 0;
}

return 0;
}

```

## Output:

```

## Observation:

Date: 13/11/20

Part-B

a) WAP for congestion control using leaky bucket algorithm

Bucket size: 10 packets (max bucket cap)  
 output rate: 1 packet/sec

Packet arrive as follows:

| Time (s) | packets arriving |
|----------|------------------|
| 0        | 6                |
| 1        | 4                |
| 2        | 8                |
| 3        | 1                |
| 4        | 0                |

Algorithm:

input: bucket-cap, leak-rate, packet-arrive rate  
 output: Table of time-wise processing

For each packets in packet-arrival so  
 time = time + 1  
 total-arrived = total-arrived + packets

bucket-content = bucket-content + packets

If bucket-content > bucket-capacity then  
 dropped = bucket-content - bucket-capacity  
 bucket-content = bucket-capacity

Else  
 dropped = 0

ENDIF

bucket-leak = bucket-content

If bucket-content > leak-rate THEN  
 leaked = leak-rate  
 bucket-content = bucket-content - leak-rate

Else  
 leaked = bucket-content  
 bucket-content = 0

Date: \_\_\_\_\_

total-dropped += dropped  
 total-leaked += leaked

Output:-

Enter the leak rate (packets/second): 3  
 Enter the bucket capacity: 10  
 Enter number of seconds to simulate: 5  
 Enter number of packets arriving each second:

Sec 1: 5  
 2: 7  
 3: 4  
 4: 6  
 5: 2

| time | packet arriving | packet in Bucket (BL) | leaked | Bucket after leak | packet dropped |
|------|-----------------|-----------------------|--------|-------------------|----------------|

## **Program 2:**

**Aim:** Using TCP/IP sockets, write a client-server program to make client sending the file name and the server to send back the contents of the requested file if present.

### **Code:**

```
# tcp_client.py

import socket

# Step 1: Create TCP socket
client_socket =
socket.socket(socket.AF_INET,
socket.SOCK_STREAM)

# Step 2: Connect to server
client_socket.connect(('localhost',
8080))

# Step 3: Send filename
filename = input("Enter filename to
request: ")

client_socket.send(filename.encode())

# Step 4: Receive file contents
data =
client_socket.recv(4096).decode()

print("\n--- File Content ---\n")
print(data)

# Step 5: Close connection
client_socket.close()
```

```
# tcp_server.py

import socket

# Step 1: Create a TCP socket
server_socket =
socket.socket(socket.AF_INET,
socket.SOCK_STREAM)

# Step 2: Bind to address and
port
server_socket.bind(('localhost',
8080))

# Step 3: Listen for client
connections
server_socket.listen(1)
print("Server is listening on
port 8080...")

# Step 4: Accept connection
conn, addr = server_socket.accept()
print("Connected by:", addr)

# Step 5: Receive file name
filename =
conn.recv(1024).decode().strip()

try:
    # Step 6: Open and read file
    with open(filename, 'r') as
f:
        data = f.read()

        conn.send(data.encode()) # Send
file contents

except FileNotFoundError:
    conn.send(b"File not found on
server.")

# Step 7: Close connection
```

|  |   |
|--|---|
|  | <code>conn.close()</code><br><code>server_socket.close</code> |
|--|---|

## Output:

### Server side Terminal:

```
pradeep-g@Pradeep-G: ~/Documents/TCP x pradeep-g@Pradeep-G: ~/Documents/TCP x v
pradeep-g@Pradeep-G:~/Documents/TCP$ python3 server.py

    # Step 3: Receive filename
    from client
    filename, addr =
server_socket.recvfrom(1024)
    filename =
filename.decode().strip()

    print(f"Requested file:
{filename}")

    try:
        # Step 4: Open file and
        send content
        with open(filename, 'r')
        as f:
            data = f.read()

            server_socket.sendto(data.
            encode(), addr)

    except FileNotFoundError:
        server_socket.sendto(b"Fil
e not found on server.", addr)
```

## Output:

### Server side Terminal:

```
pradeep-g@Pradeep-G: ~/Documents/UDP
pradeep-g@Pradeep-G: ~/Documents/UDP$ python3 server.py
UDP Server is ready...
Requested file: run_code.txt
```

### Client side Terminal:

```
pradeep-g@Pradeep-G: ~/Documents/UDP
pradeep-g@Pradeep-G: ~/Documents/UDP$ python3 client.py
Enter filename to request: run_code.txt

--- File Content ---

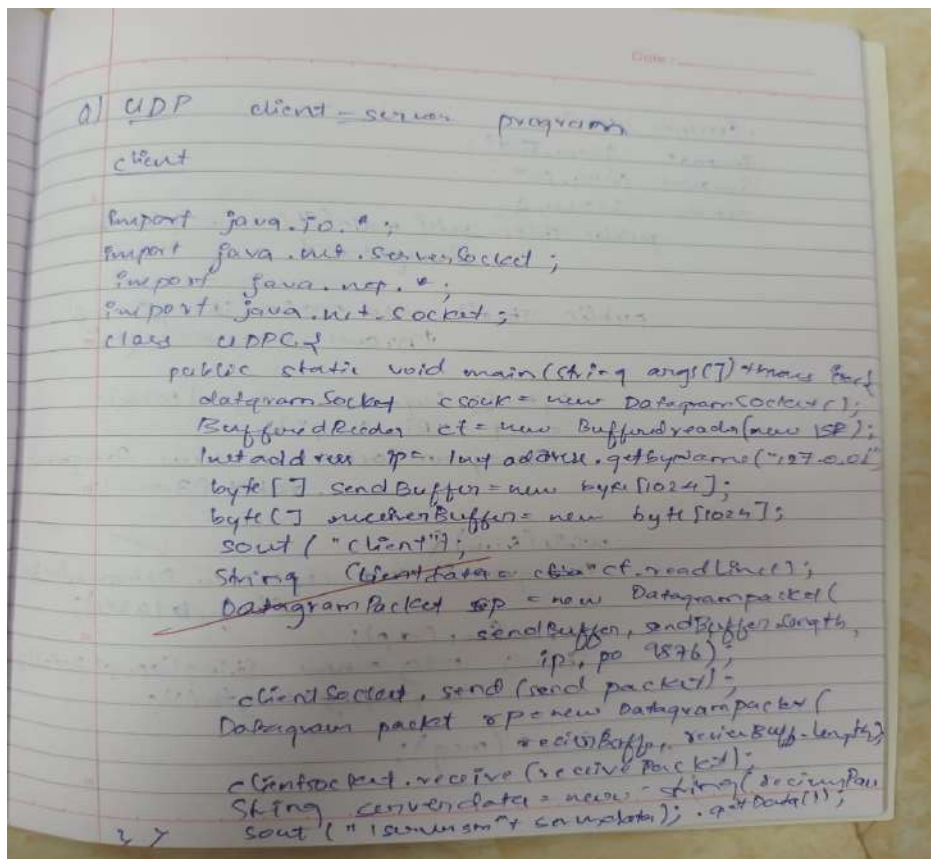

How to Run in Ubuntu
Terminal 1: Start the server
python3 udp_server.py

Terminal 2: Run the client
python3 udp_client.py

Enter a filename
Example:
sample.txt

pradeep-g@Pradeep-G: ~/Documents/UDP$
```

Hi

Hello

#### **Program 4:**

**Aim:** Write a program for error detecting code using CRC-CCITT (16-bits).

#### **Code:**

```
#include <stdio.h>
#include <string.h>
#include <stdlib.h>

int main() {
    char rem[50], a[50], s[50], c, msj[50], gen[30];
    int i, genlen, t, j, flag = 0, k, n;

    printf("Enter the generation polynomial:\n");
    gets(gen);
    printf("Generator polynomial is CRC-CCITT: %s\n", gen);

    genlen = strlen(gen);
    k = genlen - 1;

    printf("Enter the message:\n");
    n = 0;
    while ((c = getchar()) != '\n') {
        msj[n] = c;
        n++;
    }
    msj[n] = '\0';

    for (i = 0; i < n; i++)
        a[i] = msj[i];
```

```

for (i = 0; i < k; i++)
    a[n + i] = '0';
a[n + k] = '\\0';

printf("\\nMessage polynomial appended with zeros:\\n");
puts(a);

for (i = 0; i < n; i++) {
    if (a[i] == '1') {
        t = i;
        for (j = 0; j <= k; j++) {
            if (a[t] == gen[j])
                a[t] = '0';
            else
                a[t] = '1';

            t++;
        }
    }
}

for (i = 0; i < k; i++)
    rem[i] = a[n + i];
rem[k] = '\\0';

printf("Checksum (remainder):\\n");
puts(rem);

printf("\\nMessage with checksum appended:\\n");
for (i = 0; i < n; i++) a[i] = msj[i];

```

```

for (i = 0; i < k; i++) a[n + i] =
rem[i];

    a[n + k] = '\0';
    puts(a);

n = 0;
printf("Enter the received message:\n");
while ((c = getchar()) != '\n') {
    s[n] = c;
    n++;
}
s[n] = '\0';

for (i = 0; i < n; i++) {
    if (s[i] == '1') {
        t = i;
        for (j = 0; j <= k; j++, t++) {
            if (s[t] == gen[j])
                s[t] = '0';
            else
                s[t] = '1';
        }
    }
}

for (i = 0; i < k; i++)
    rem[i] = s[n + i];
rem[k] = '\0';

for (i = 0; i < k; i++)

```

```

if (rem[i] == '1') flag = 1;
    }

    if (flag == 0)
        printf("Received polynomial is error-free \n");
    else
        printf("Received polynomial contains error \n");

    return 0;
}

```

## Output:

```

C:\Users\Admin\Document
Enter the generation polynomial:
101
Generator polynomial is CRC-CCITT: 101
Enter the message:
11010101010100

Message polynomial appended with zeros:
1101010101010000
Checksum (remainder):
11

Message with checksum appended:
1101010101010011
Enter the received message:
1101010101010011
Received polynomial is error-free

Process returned 0 (0x0)   execution time : 33.192 s
Press any key to continue.

```

## Observation:

Total packets produced = 24  
Total packets dropped = 4

H WAP for error detecting code using CRC CCITT (16 bits)

CRC-CCITT (data, polynomial =  $0 \times 1021$ ,  
Initial-value =  $0 \times FFFF$ )

$crc \leftarrow \text{initial-value}$

For each byte in data do  
 $crc \leftarrow crc \text{ XOR } (b \ll 8)$

for  $i \leftarrow 1$  to 8 do

if  $(crc \text{ AND } 0 \times 8000) \neq 0$  then

$crc \leftarrow (crc \ll 1) \text{ XOR polynomial}$

else

$crc \leftarrow (crc \ll 1) \text{ XOR } 0$

end if

$crc \leftarrow crc \text{ AND } 0 \times FFFF$   
end for  
end for

return crc  
End algorithm

Output:

Input = "HELLO"  
Final CRC =  $0 \times 49D6$
